herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[44287] The complementary binding of VGAM1238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1238 host target RNA into VGAM1238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44288] It is appreciated that VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1238 host target genes. The mRNA of each one of this plurality of VGAM1238 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1238 RNA, herein designated VGAM RNA, and which when bound by VGAM1238 RNA causes inhibition of translation of respective one or more

VGAM1238 host target proteins.

[44289] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1238 gene, herein designated VGAM GENE, on one or more VGAM1238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44290] It is yet further appreciated that a function of VGAM1238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Spe-

cific functions, and accordingly utilities, of VGAM1238 correlate with, and may be deduced from, the identity of the host target genes which VGAM1238 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44291] Nucleotide sequences of the VGAM1238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1238 are further described hereinbelow with reference to Table 1.

[44292] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1238 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1238 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44293] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1238 gene, herein designated VGAM is inhibition of expression of VGAM1238 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1238 correlate with, and may be deduced from, the identity of the target genes which VGAM1238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44294] AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027) is a VGAM1238 host target gene. AXUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, designated SEQ ID:26916, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44295] A function of VGAM1238 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM_033027). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030) is another VGAM1238 host target gene. CACNA2D2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CACNA2D2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNA2D2 BINDING SITE, designated SEQ ID:12647, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44296] Another function of VGAM1238 is therefore inhibition of Calcium Channel, Voltage-dependent, Alpha 2/delta Subunit 2 (CACNA2D2, Accession NM_006030), a gene which is a calcium channel protein which plays an important role in excitation-contraction coupling. Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNA2D2. The function of CACNA2D2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM203. Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is another VGAM1238 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34977, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44297] Another function of VGAM1238 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Peroxisome Biogenesis Factor 10 (PEX10, Accession NM_002617) is another VGAM1238 host target gene. PEX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:8478, to the nucleotide sequence of

VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44298] Another function of VGAM1238 is therefore inhibition of Peroxisome Biogenesis Factor 10 (PEX10, Accession NM_002617). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX10. Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096) is another VGAM1238 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BINDING SITE, designated SEQ ID:33687, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44299] Another function of VGAM1238 is therefore inhibition of Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM_042096). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B.

Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM_002353) is another VGAM1238 host target gene. TACSTD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACSTD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACSTD2 BINDING SITE, designated SEQ ID:8157, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44300] Another function of VGAM1238 is therefore inhibition of Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM_002353), a gene which belongs to ga733 tumor-associated antigen gene family and may function as growth factor receptors. Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACSTD2. The function of TACSTD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.DKFZP564D116 (Accession XM_051050) is another VGAM1238 host target gene. DK-

FZP564D116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D116 BINDING SITE, designated SEQ ID:35733, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44301] Another function of VGAM1238 is therefore inhibition of DKFZP564D116 (Accession XM_051050). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D116. FLJ14855 (Accession NM_033210) is another VGAM1238 host target gene. FLJ14855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14855 BINDING SITE, designated SEQ ID:27057, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44302] Another function of VGAM1238 is therefore inhibition of FLJ14855 (Accession NM_033210). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14855. FLJ21709 (Accession XM_085480) is another VGAM1238 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38166, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44303] Another function of VGAM1238 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. FLJ22477 (Accession NM_024735) is another VGAM1238 host target gene. FLJ22477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22477 BINDING SITE, designated SEQ ID:24074, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44304] Another function of VGAM1238 is therefore inhibition of FLJ22477 (Accession NM_024735). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22477. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044) is another VGAM1238 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:17396 and SEQ ID:28916 respectively, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44305] Another function of VGAM1238 is therefore inhibition of

Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_015044). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. MGC16075 (Accession NM_032761) is another VGAM1238 host target gene. MGC16075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16075 BINDING SITE, designated SEQ ID:26503, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44306] Another function of VGAM1238 is therefore inhibition of MGC16075 (Accession NM_032761). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16075. POPX1 (Accession NM_014906) is another VGAM1238 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17115, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44307] Another function of VGAM1238 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. RALGPS1A (Accession NM_014636) is another VGAM1238 host target gene. RALGPS1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALGPS1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALGPS1A BINDING SITE, designated SEQ ID:16013, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44308] Another function of VGAM1238 is therefore inhibition of RALGPS1A (Accession NM_014636). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

RALGPS1A. RSP3 (Accession NM_031924) is another VGAM1238 host target gene. RSP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RSP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RSP3 BINDING SITE, designated SEQ ID:25671, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44309] Another function of VGAM1238 is therefore inhibition of RSP3 (Accession NM_031924). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RSP3. LOC138399 (Accession XM_059971) is another VGAM1238 host target gene. LOC138399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138399 BINDING SITE, designated SEQ ID:37129, to the nucleotide sequence of VGAM1238 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3949.

[44310] Another function of VGAM1238 is therefore inhibition of LOC138399 (Accession XM_059971). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138399. LOC139231 (Accession XM_060020) is another VGAM1238 host target gene. LOC139231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139231 BINDING SITE, designated SEQ ID:37141, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44311] Another function of VGAM1238 is therefore inhibition of LOC139231 (Accession XM_060020). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139231. LOC149706 (Accession XM_097718) is another VGAM1238 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41056, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44312] Another function of VGAM1238 is therefore inhibition of LOC149706 (Accession XM_097718). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC150282 (Accession XM_086852) is another VGAM1238 host target gene. LOC150282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150282 BINDING SITE, designated SEQ ID:38918, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44313] Another function of VGAM1238 is therefore inhibition of LOC150282 (Accession XM_086852). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150282. LOC221474 (Accession XM_166464) is another VGAM1238 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44376, to the nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44314] Another function of VGAM1238 is therefore inhibition of LOC221474 (Accession XM_166464). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221474. LOC93589 (Accession XM_052387) is another VGAM1238 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35974, to the

nucleotide sequence of VGAM1238 RNA, herein designated VGAM RNA, also designated SEQ ID:3949.

[44315] Another function of VGAM1238 is therefore inhibition of LOC93589 (Accession XM_052387). Accordingly, utilities of VGAM1238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1239 (VGAM1239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44316] VGAM1239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1239 was detected is described hereinabove with reference to Figs. 1–8.

[44317] VGAM1239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44318] VGAM1239 gene encodes a VGAM1239 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1239 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1239 precursor RNA is designated SEQ ID:1225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1225 is located at position 106225 relative to the genome of Bovine Herpesvirus 4.

[44319] VGAM1239 precursor RNA folds onto itself, forming VGAM1239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44320] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1239 folded precursor RNA into VGAM1239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1239 RNA is designated SEQ ID:3950, and is provided hereinbelow with reference to the sequence listing part.

[44321] VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1239 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44322] VGAM1239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1239 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44323] The complementary binding of VGAM1239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1239 host target RNA into VGAM1239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44324] It is appreciated that VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1239 host target genes. The mRNA of each one of this plurality of VGAM1239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1239 RNA, herein designated VGAM RNA, and which when bound by VGAM1239 RNA causes inhibition of translation of respective one or more VGAM1239 host target proteins.

[44325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1239 gene, herein designated VGAM GENE, on one or more VGAM1239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[44326] It is yet further appreciated that a function of VGAM1239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1239 correlate with, and may be deduced from, the identity of the host target genes which VGAM1239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44327] Nucleotide sequences of the VGAM1239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1239 are further described hereinbelow with reference to Table 1.

[44328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1239 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44329] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1239 gene, herein designated VGAM is inhibition of expression of VGAM1239 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1239 correlate with, and may be deduced from, the identity of the target genes which VGAM1239 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44330] Collagen, Type III, Alpha 1 (Ehlers–Danlos syndrome type IV, autosomal dominant) (COL3A1, Accession NM_000090) is a VGAM1239 host target gene. COL3A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by COL3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL3A1 BINDING SITE, designated SEQ ID:5543, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44331] A function of VGAM1239 is therefore inhibition of Colla–

gen, Type III, Alpha 1 (Ehlers–Danlos syndrome type IV, autosomal dominant) (COL3A1, Accession NM_000090). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL3A1. CXYorf1 (Accession XM_088704) is another VGAM1239 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39903, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44332] Another function of VGAM1239 is therefore inhibition of CXYorf1 (Accession XM_088704). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. TRIP–Br2 (Accession NM_014755) is another VGAM1239 host target gene. TRIP–Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP–Br2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16490, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44333] Another function of VGAM1239 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC199725 (Accession XM_117119) is another VGAM1239 host target gene. LOC199725 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199725 BINDING SITE, designated SEQ ID:43241, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44334] Another function of VGAM1239 is therefore inhibition of LOC199725 (Accession XM_117119). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC199725. LOC200093 (Accession XM_032184) is another VGAM1239 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31595, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44335] Another function of VGAM1239 is therefore inhibition of LOC200093 (Accession XM_032184). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. LOC91040 (Accession XM_035641) is another VGAM1239 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32312, to the

nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44336] Another function of VGAM1239 is therefore inhibition of LOC91040 (Accession XM_035641). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. LOC91464 (Accession XM_038589) is another VGAM1239 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:32873, to the nucleotide sequence of VGAM1239 RNA, herein designated VGAM RNA, also designated SEQ ID:3950.

[44337] Another function of VGAM1239 is therefore inhibition of LOC91464 (Accession XM_038589). Accordingly, utilities of VGAM1239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1240 (VGAM1240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44338] VGAM1240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1240 was detected is described hereinabove with reference to Figs. 1–8.

[44339] VGAM1240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44340] VGAM1240 gene encodes a VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1240 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1240 precursor RNA is designated SEQ ID:1226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1226 is located at position 100575 relative to the genome of Bovine Herpesvirus 4.

[44341] VGAM1240 precursor RNA folds onto itself, forming VGAM1240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44342] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1240 folded precursor RNA into VGAM1240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1240 RNA is designated SEQ ID:3951, and is provided hereinbelow with reference to the sequence listing part.

[44343] VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1240 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1240 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44344] VGAM1240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1240 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44345] The complementary binding of VGAM1240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1240 host target RNA into VGAM1240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44346] It is appreciated that VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1240 host target genes. The mRNA of each one of this plurality of VGAM1240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1240 RNA, herein designated VGAM RNA, and which when bound by VGAM1240 RNA causes inhibition of translation of respective one or more VGAM1240 host target proteins.

[44347] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1240 gene, herein designated VGAM GENE, on one or more VGAM1240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44348] It is yet further appreciated that a function of VGAM1240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1240 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44349] Nucleotide sequences of the VGAM1240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1240 are further described hereinbelow with reference to Table 1.

[44350] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1240 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44351] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1240 gene, herein designated VGAM is inhibition of expression of VGAM1240 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1240 correlate with, and may be deduced from, the identity of the target genes which VGAM1240

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44352] Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862) is a VGAM1240 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16931, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44353] A function of VGAM1240 is therefore inhibition of Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. Arginine Vasopressin Recep–

tor 1A (AVPR1A, Accession NM_000706) is another VGAM1240 host target gene. AVPR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AVPR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AVPR1A BINDING SITE, designated SEQ ID:6377, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44354] Another function of VGAM1240 is therefore inhibition of Arginine Vasopressin Receptor 1A (AVPR1A, Accession NM_000706), a gene which mediates cell contraction and proliferation, platelet aggregation, release of coagulation factor, and glycogenolysis. Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AVPR1A. The function of AVPR1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM549. Kelch-like 2, Mayven (*Drosophila*) (KLHL2, Accession NM_007246) is another VGAM1240 host target gene. KLHL2 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KLHL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL2 BINDING SITE, designated SEQ ID:14113, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44355] Another function of VGAM1240 is therefore inhibition of Kelch-like 2, Mayven (Drosophila) (KLHL2, Accession NM_007246). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL2. Mannose Receptor, C Type 1 (MRC1, Accession NM_002438) is another VGAM1240 host target gene. MRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRC1 BINDING SITE, designated SEQ ID:8280, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44356] Another function of VGAM1240 is therefore inhibition of Mannose Receptor, C Type 1 (MRC1, Accession NM_002438), a gene which mediates the endocytosis of glycoproteins. Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRC1. The function of MRC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1217. Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11, Accession NM_002474) is another VGAM1240 host target gene. MYH11 BINDING SITE1 and MYH11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MYH11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYH11 BINDING SITE1 and MYH11 BINDING SITE2, designated SEQ ID:8303 and SEQ ID:23145 respectively, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44357] Another function of VGAM1240 is therefore inhibition of Myosin, Heavy Polypeptide 11, Smooth Muscle (MYH11,

Accession NM_002474), a gene which is involved in muscle contraction. Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYH11. The function of MYH11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.CG018 (Accession NM_052818) is another VGAM1240 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27402, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44358] Another function of VGAM1240 is therefore inhibition of CG018 (Accession NM_052818). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018. DKFZP434B172 (Accession XM_046264) is another VGAM1240 host target gene. DKFZP434B172 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B172 BINDING SITE, designated SEQ ID:34701, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44359] Another function of VGAM1240 is therefore inhibition of DKFZP434B172 (Accession XM_046264). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B172. DKFZP564M182 (Accession XM_085525) is another VGAM1240 host target gene. DKFZP564M182 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564M182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564M182 BINDING SITE, designated SEQ ID:38217, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3951.

[44360] Another function of VGAM1240 is therefore inhibition of DKFZP564M182 (Accession XM_085525). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564M182. FLJ10830 (Accession NM_018235) is another VGAM1240 host target gene. FLJ10830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10830 BINDING SITE, designated SEQ ID:20185, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44361] Another function of VGAM1240 is therefore inhibition of FLJ10830 (Accession NM_018235). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10830. FLJ12572 (Accession NM_022905) is another VGAM1240 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12572, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23200, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44362] Another function of VGAM1240 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ12592 (Accession NM_032169) is another VGAM1240 host target gene. FLJ12592 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:25877, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44363] Another function of VGAM1240 is therefore inhibition of FLJ12592 (Accession NM_032169). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12592. HSPC043 (Accession XM_041943) is another VGAM1240 host target gene. HSPC043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC043 BINDING SITE, designated SEQ ID:33638, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44364] Another function of VGAM1240 is therefore inhibition of HSPC043 (Accession XM_041943). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC043. KIAA0052 (Accession XM_042108) is another VGAM1240 host target gene. KIAA0052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0052 BINDING SITE, designated SEQ ID:33693, to the

nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44365] Another function of VGAM1240 is therefore inhibition of KIAA0052 (Accession XM_042108). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0052. KIAA0532 (Accession XM_047659) is another VGAM1240 host target gene. KIAA0532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0532 BINDING SITE, designated SEQ ID:35020, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44366] Another function of VGAM1240 is therefore inhibition of KIAA0532 (Accession XM_047659). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0532. KIAA1719 (Accession XM_042936) is another VGAM1240 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33823, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44367] Another function of VGAM1240 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277) is another VGAM1240 host target gene. KLK7 BINDING SITE1 and KLK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE1 and KLK7 BINDING SITE2, designated SEQ ID:29276 and SEQ ID:11479 respectively, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44368] Another function of VGAM1240 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7. MGC27382 (Accession NM_144700) is another VGAM1240 host target gene. MGC27382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC27382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC27382 BINDING SITE, designated SEQ ID:29522, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44369] Another function of VGAM1240 is therefore inhibition of MGC27382 (Accession NM_144700). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC27382. MISS (Accession NM_144578) is another VGAM1240 host target gene. MISS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MISS, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MISS BINDING SITE, designated SEQ ID:29383, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44370] Another function of VGAM1240 is therefore inhibition of MISS (Accession NM_144578). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MISS. Neurolysin (metallopeptidase M3 family) (NLN, Accession NM_020726) is another VGAM1240 host target gene. NLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLN BINDING SITE, designated SEQ ID:21858, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44371] Another function of VGAM1240 is therefore inhibition of Neurolysin (metallopeptidase M3 family) (NLN, Accession NM_020726). Accordingly, utilities of VGAM1240 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NLN. PRO0097 (Accession NM_014114) is another VGAM1240 host target gene. PRO0097 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0097, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0097 BINDING SITE, designated SEQ ID:15362, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44372] Another function of VGAM1240 is therefore inhibition of PRO0097 (Accession NM_014114). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0097. RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918) is another VGAM1240 host target gene. RERG BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RERG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RERG BINDING SITE, designated SEQ ID:26736, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44373] Another function of VGAM1240 is therefore inhibition of RAS-like, Estrogen-regulated, Growth-inhibitor (RERG, Accession NM_032918). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERG. LOC123435 (Accession XM_058706) is another VGAM1240 host target gene. LOC123435 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123435 BINDING SITE, designated SEQ ID:36724, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44374] Another function of VGAM1240 is therefore inhibition of LOC123435 (Accession XM_058706). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC123435. LOC147837 (Accession XM_085915) is another VGAM1240 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:38394, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44375] Another function of VGAM1240 is therefore inhibition of LOC147837 (Accession XM_085915). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC153894 (Accession XM_087796) is another VGAM1240 host target gene. LOC153894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153894 BINDING SITE, designated SEQ ID:39428, to the nucleotide sequence of VGAM1240 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3951.

[44376] Another function of VGAM1240 is therefore inhibition of LOC153894 (Accession XM_087796). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153894. LOC154442 (Accession XM_098536) is another VGAM1240 host target gene. LOC154442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154442 BINDING SITE, designated SEQ ID:41707, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44377] Another function of VGAM1240 is therefore inhibition of LOC154442 (Accession XM_098536). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154442. LOC255328 (Accession XM_172920) is another VGAM1240 host target gene. LOC255328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255328, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:46177, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44378] Another function of VGAM1240 is therefore inhibition of LOC255328 (Accession XM_172920). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328. LOC51696 (Accession NM_016217) is another VGAM1240 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18305, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44379] Another function of VGAM1240 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC51696. LOC91012 (Accession XM_035503) is another VGAM1240 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32284, to the nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44380] Another function of VGAM1240 is therefore inhibition of LOC91012 (Accession XM_035503). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. LOC91380 (Accession XM_038134) is another VGAM1240 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32760, to the

nucleotide sequence of VGAM1240 RNA, herein designated VGAM RNA, also designated SEQ ID:3951.

[44381] Another function of VGAM1240 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM1240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1241 (VGAM1241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44382] VGAM1241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1241 was detected is described hereinabove with reference to Figs. 1–8.

[44383] VGAM1241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 3. VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44384] VGAM1241 gene encodes a VGAM1241 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1241 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1241 precursor RNA is designated SEQ ID:1227, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1227 is located at position 107745 relative to the genome of Gallid Herpesvirus 3.

[44385] VGAM1241 precursor RNA folds onto itself, forming VGAM1241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1241 folded precursor RNA into VGAM1241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1241 RNA is designated SEQ ID:3952, and is provided hereinbelow with reference to the sequence listing part.

[44387] VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1241 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44388] VGAM1241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1241 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44389] The complementary binding of VGAM1241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1241 host target RNA into VGAM1241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44390] It is appreciated that VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1241 host target genes. The mRNA of each one of this plurality of VGAM1241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1241 RNA, herein designated VGAM RNA, and which when bound by VGAM1241 RNA causes inhibition of translation of respective one or more VGAM1241 host target proteins.

[44391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1241 gene, herein designated VGAM GENE, on one or more VGAM1241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[44392] It is yet further appreciated that a function of VGAM1241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1241 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1241 correlate with, and may be deduced from, the identity of the host target genes which VGAM1241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44393] Nucleotide sequences of the VGAM1241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1241 are further described hereinbelow with reference to Table 1.

[44394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1241 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44395] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1241 gene, herein designated VGAM is inhibition of expression of VGAM1241 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1241 correlate with, and may be deduced from, the identity of the target genes which VGAM1241 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44396] PORIMIN (Accession NM_052932) is a VGAM1241 host target gene. PORIMIN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PORIMIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PORIMIN BINDING SITE, designated SEQ ID:27492, to the nucleotide sequence of VGAM1241 RNA, herein designated VGAM RNA, also designated SEQ ID:3952.

[44397] A function of VGAM1241 is therefore inhibition of PORIMIN (Accession NM_052932). Accordingly, utilities of

VGAM1241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PORIMIN. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1242 (VGAM1242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44398] VGAM1242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1242 was detected is described hereinabove with reference to Figs. 1–8.

[44399] VGAM1242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Gallid Herpesvirus 3. VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44400] VGAM1242 gene encodes a VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1242 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu–

cleotide sequence of VGAM1242 precursor RNA is designated SEQ ID:1228, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1228 is located at position 101522 relative to the genome of Gallid Herpesvirus 3.

- [44401] VGAM1242 precursor RNA folds onto itself, forming VGAM1242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44402] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1242 folded precursor RNA into VGAM1242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1242 RNA is designated SEQ ID:3953, and

is provided hereinbelow with reference to the sequence listing part.

[44403] VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1242 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44404] VGAM1242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1242 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44405] The complementary binding of VGAM1242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1242 host target RNA into VGAM1242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44406] It is appreciated that VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1242 host target genes. The mRNA of each one of this plurality of VGAM1242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1242 RNA, herein designated VGAM RNA, and which when bound by VGAM1242 RNA causes inhibition of translation of respective one or more VGAM1242 host target proteins.

[44407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1242 gene, herein designated VGAM GENE, on one or more VGAM1242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44408] It is yet further appreciated that a function of VGAM1242 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of viral infection by Gallid Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1242 correlate with, and may be deduced from, the identity of the host target genes which VGAM1242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44409] Nucleotide sequences of the VGAM1242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1242 are further described hereinbelow with reference to Table 1.

[44410] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1242 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44411] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1242 gene, herein designated VGAM is inhibition of expression of VGAM1242 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1242 correlate with, and may be deduced from, the identity of the target genes which VGAM1242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44412] Carnitine O-octanoyltransferase (CROT, Accession NM_021151) is a VGAM1242 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22122, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44413] A function of VGAM1242 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid. Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with CROT. The function of CROT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM70. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396) is another VGAM1242 host target gene. DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3, designated SEQ ID:7093, SEQ ID:28186 and SEQ ID:28163 respectively, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44414] Another function of VGAM1242 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM_001396), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728) is another VGAM1242 host target gene. UNC5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UNC5C BINDING SITE, designated SEQ ID:9821, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44415] Another function of VGAM1242 is therefore inhibition of Unc-5 Homolog B (C. elegans) (UNC5C, Accession NM_003728), a gene which is a putative receptor for netrin, which is involved in axon guidance. Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5C. The function of UNC5C and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM298.KIAA0599 (Accession XM_085127) is another VGAM1242 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37853, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44416] Another function of VGAM1242 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. MGC11266 (Accession NM_024322) is another VGAM1242 host target gene. MGC11266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC11266 BINDING SITE, designated SEQ ID:23611, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44417] Another function of VGAM1242 is therefore inhibition of MGC11266 (Accession NM_024322). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11266. TUSP (Accession NM_020245) is another VGAM1242 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21539, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44418] Another function of VGAM1242 is therefore inhibition of TUSP (Accession NM_020245). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Zinc Finger Protein 262 (ZNF262, Accession NM_005095) is another VGAM1242 host target gene. ZNF262 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF262 BINDING SITE, designated SEQ ID:11556, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44419] Another function of VGAM1242 is therefore inhibition of Zinc Finger Protein 262 (ZNF262, Accession NM_005095). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF262. LOC147072 (Accession XM_017121) is another VGAM1242 host target gene. LOC147072 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147072 BINDING SITE, designated SEQ ID:30301, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44420] Another function of VGAM1242 is therefore inhibition of LOC147072 (Accession XM_017121). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147072. LOC147976 (Accession XM_085980) is another VGAM1242 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38429, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44421] Another function of VGAM1242 is therefore inhibition of LOC147976 (Accession XM_085980). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC148645 (Accession XM_097492) is another VGAM1242 host target gene. LOC148645 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148645, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148645 BINDING SITE, designated SEQ ID:40891, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44422] Another function of VGAM1242 is therefore inhibition of LOC148645 (Accession XM_097492). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148645. LOC164397 (Accession XM_092780) is another VGAM1242 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40153, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44423] Another function of VGAM1242 is therefore inhibition of LOC164397 (Accession XM_092780). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC164397. LOC253985 (Accession XM_172875) is another VGAM1242 host target gene. LOC253985 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253985 BINDING SITE, designated SEQ ID:46151, to the nucleotide sequence of VGAM1242 RNA, herein designated VGAM RNA, also designated SEQ ID:3953.

[44424] Another function of VGAM1242 is therefore inhibition of LOC253985 (Accession XM_172875). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253985. LOC93444 (Accession XM_051455) is another VGAM1242 host target gene. LOC93444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93444 BINDING SITE, designated SEQ ID:35843, to the nucleotide sequence of VGAM1242 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3953.

[44425] Another function of VGAM1242 is therefore inhibition of LOC93444 (Accession XM_051455). Accordingly, utilities of VGAM1242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93444. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1243 (VGAM1243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44426] VGAM1243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1243 was detected is described hereinabove with reference to Figs. 1–8.

[44427] VGAM1243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3. VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44428] VGAM1243 gene encodes a VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1243 precursor RNA is designated SEQ ID:1229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1229 is located at position 18764 relative to the genome of Turkey Adenovirus 3.

- [44429] VGAM1243 precursor RNA folds onto itself, forming VGAM1243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44430] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1243 folded precursor RNA into VGAM1243 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1243 RNA is designated SEQ ID:3954, and is provided hereinbelow with reference to the sequence listing part.

[44431] VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1243 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44432] VGAM1243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1243 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44433] The complementary binding of VGAM1243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1243 host target RNA into VGAM1243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44434] It is appreciated that VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1243 host target genes. The mRNA of

each one of this plurality of VGAM1243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1243 RNA, herein designated VGAM RNA, and which when bound by VGAM1243 RNA causes inhibition of translation of respective one or more VGAM1243 host target proteins.

[44435] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1243 gene, herein designated VGAM GENE, on one or more VGAM1243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[44436] It is yet further appreciated that a function of VGAM1243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM1243 correlate with, and may be deduced from, the identity of the host target genes which VGAM1243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44437] Nucleotide sequences of the VGAM1243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1243 are further described hereinbelow with reference to Table 1.

[44438] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1243 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1243 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44439] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1243 gene, herein designated VGAM is inhibition of expression of VGAM1243 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1243 correlate with, and may be deduced from, the identity of the target genes which VGAM1243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44440] Luteinizing Hormone/choriogonadotropin Receptor (LHCGR, Accession NM_000233) is a VGAM1243 host target gene. LHCGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHCGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHCGR BINDING SITE, designated SEQ ID:5744, to the nucleotide sequence of VGAM1243 RNA, herein designated VGAM RNA, also designated SEQ ID:3954.

[44441] A function of VGAM1243 is therefore inhibition of Luteinizing Hormone/choriogonadotropin Receptor

(LHCGR, Accession NM_000233). Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHCGR. Thymine–DNA Glycosylase (TDG, Accession NM_003211) is another VGAM1243 host target gene. TDG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TDG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TDG BINDING SITE, designated SEQ ID:9205, to the nucleotide sequence of VGAM1243 RNA, herein designated VGAM RNA, also designated SEQ ID:3954.

[44442] Another function of VGAM1243 is therefore inhibition of Thymine–DNA Glycosylase (TDG, Accession NM_003211), a gene which excises uracil and thymine from mispairs with guanine. Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDG. The function of TDG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM196.KIAA1497 (Accession XM_041431) is another

VGAM1243 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33522, to the nucleotide sequence of VGAM1243 RNA, herein designated VGAM RNA, also designated SEQ ID:3954.

[44443] Another function of VGAM1243 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. MGC12679 (Accession NM_032733) is another VGAM1243 host target gene. MGC12679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12679 BINDING SITE, designated SEQ ID:26458, to the nucleotide sequence of VGAM1243 RNA, herein designated VGAM RNA, also designated SEQ ID:3954.

[44444] Another function of VGAM1243 is therefore inhibition of MGC12679 (Accession NM_032733). Accordingly, utilities of VGAM1243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12679. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1244 (VGAM1244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44445] VGAM1244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1244 was detected is described hereinabove with reference to Figs. 1-8.

[44446] VGAM1244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3. VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44447] VGAM1244 gene encodes a VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1244 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1244 precursor RNA is designated SEQ ID:1230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1230 is located at position 24452 relative to the genome of Turkey Adenovirus 3.

- [44448] VGAM1244 precursor RNA folds onto itself, forming VGAM1244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44449] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1244 folded precursor RNA into VGAM1244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1244 RNA is designated SEQ ID:3955, and is provided hereinbelow with reference to the sequence listing part.

[44450] VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1244 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[44451] VGAM1244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1244 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44452] The complementary binding of VGAM1244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1244 host target RNA into VGAM1244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44453] It is appreciated that VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1244 host target genes. The mRNA of each one of this plurality of VGAM1244 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1244 RNA, herein designated VGAM RNA, and which when bound by VGAM1244 RNA causes inhibition of translation of respective one or more VGAM1244 host target proteins.

[44454] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1244 gene, herein designated VGAM GENE, on one or more VGAM1244 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44455] It is yet further appreciated that a function of VGAM1244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM1244 correlate with, and may be deduced from, the identity of the host target genes which VGAM1244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44456] Nucleotide sequences of the VGAM1244 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1244 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1244 are further described hereinbelow with reference to Table 1.

[44457] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1244 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1244 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[44458] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1244 gene, herein designated VGAM is inhibition of expression of VGAM1244 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1244 correlate with, and may be deduced from, the identity of the target genes which VGAM1244 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44459] Coxsackie Virus and Adenovirus Receptor (CXADR, Accession NM_001338) is a VGAM1244 host target gene. CXADR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXADR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXADR BINDING SITE, designated SEQ ID:7018, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44460] A function of VGAM1244 is therefore inhibition of Coxsackie Virus and Adenovirus Receptor (CXADR, Accession NM_001338), a gene which is a member of the immunoglobulin superfamily. Accordingly, utilities of

VGAM1244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXADR. The function of CXADR has been established by previous studies. Bergelson et al. (1997) used immunoaffinity chromatography to purify a Coxsackie virus and adenovirus receptor protein, which they termed CAR. Based on the sequences of tryptic peptides, they cloned the corresponding cDNA from a HeLa cell library. The CAR cDNA encodes a predicted 365-amino acid polypeptide that contains a single transmembrane domain and is a member of the immunoglobulin superfamily. Bergelson et al. (1997) found that Chinese hamster cells bound to labeled Coxsackie viruses B3 and B4 and became susceptible to infection when transfected with CAR cDNA. Myocarditis and dilated cardiomyopathy are common causes of morbidity and mortality in children. Many studies have implicated the enteroviruses and particularly the Coxsackie virus B family as etiologic agents of the acquired forms of these diseases. However, Martin et al. (1994), Griffin et al. (1995), and Pauschinger et al. (1999) showed that the group C adenoviruses are as commonly detected as enteroviruses in the myocardium of children and adults with these diseases. The description of the common Coxsackie

virus B and adenovirus receptor offers a partial explanation for the observation that 2 such divergent virus families cause these diseases.

[44461] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44462] Bergelson, J. M.; Cunningham, J. A.; Droguett, G.; Kurt-Jones, E. A.; Krithivas, A.; Hong, J. S.; Horwitz, M. S.; Crowell, R. L.; Finberg, R. W. : Isolation of a common receptor for coxsackie B viruses and adenoviruses 2 and 5. Science 275: 1320–1323, 1997. ; and

[44463] Pauschinger, M.; Bowles, N. E.; Fuentes–Garcia, F. J.; Pham, V.; Kuhl, U.; Schwimmbeck, P. L.; Schultheiss, H.–P.; Towbin, J. A. : Detection of adenoviral genome in the myocardium of adu.

[44464] Further studies establishing the function and utilities of CXADR are found in John Hopkins OMIM database record ID 602621, and in cited publications numbered 8554–8560 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149) is another VGAM1244 host target gene. MEIS2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by MEIS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEIS2 BINDING SITE, designated SEQ ID:21345, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44465] Another function of VGAM1244 is therefore inhibition of Meis1, Myeloid Ecotropic Viral Integration Site 1 Homolog 2 (mouse) (MEIS2, Accession NM_020149), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEIS2. The function of MEIS2 has been established by previous studies. The Meis1 locus (OMIM Ref. No. 601739) was isolated as a common site of viral integration involved in myeloid leukemia in BXH-2 mice. Steelman et al. (1997) noted that MEIS1 encodes a homeo box protein belonging to the TALE ('three amino acid loop extension') family of homeodomain-containing proteins. The homeodomain of MEIS1 is the only conserved motif in the entire 390-amino acid protein. Steel-

man et al. (1997) reported that Southern blot analyses using the MEIS1 homeodomain as a probe revealed the existence of a family of Meis1-related genes (MRGs) in several divergent species. In addition, the 3-prime untranslated region (UTR) of MEIS1 is remarkably conserved in evolution. Steelman et al. (1997) cloned Meis1-related genes from the mouse and human genomes. One such gene, which the authors designated Mrg1, shares a similar genomic organization in the mouse with Meis1 but was found to be located on mouse chromosome 2, not mouse chromosome 11, where Meis1 maps. In humans, Steelman et al. (1997) mapped MRG1 to 15q22-q25 in a region associated with various cytogenetic abnormalities associated with acute myelocytic leukemia, chronic myeloid leukemia, and astrocytomas. The authors reported data suggesting that another related gene (MRG2) maps to human chromosome 17. During the course of their studies of the human MEIS1 homeo box gene, Smith et al. (1997) identified a gene closely related but not identical to MEIS1. Sequence analysis showed it to be the human counterpart of the mouse gene Meis2 (Nakamura et al., 1996). Human MEIS2 was found to be expressed in various human tissues. In hematopoietic tissues, the lymphoid organs expressed

high levels of MEIS2 as 2 transcripts of 4.0 kb and 3.5 kb. MEIS2 is also expressed in some regions of the brain, such as the putamen. Nakamura et al. (1996) mapped the mouse Meis2 gene to chromosome 2 in a region syntenic to human 15q. By fluorescence in situ hybridization with a genomic MEIS2 clone, Smith et al. (1997) mapped the human MEIS2 gene to a position that is 27% of the distance from the chromosome 15 centromere to the telomere, corresponding to 15q14. Capdevila et al. (1999) showed that restriction of expression of the chick homeobox gene Meis2 to proximal regions of the limb bud is essential for limb development, since ectopic Meis2 severely disrupted limb outgrowth. They also uncovered an antagonistic relationship between the secreted factor Gremlin (OMIM Ref. No. 603054) and the bone morphogenetic proteins (Bmps; OMIM Ref. No. 112264) that is required to maintain the Sonic hedgehog (OMIM Ref. No. 600725)/fibroblast growth factor (see OMIM Ref. No. 131220) loop that regulates distal outgrowth. These proximal and distal factors were found to have coordinated activities: Meis2 could repress distal genes, and the Bmp and Hoxd (OMIM Ref. No. 142987) genes restricted Meis2 expression to the proximal limb bud. Moreover, combinations of Bmps and apical

ectodermal ridge (AER) factors were sufficient to distalize proximal limb cells. These results unveiled a set of proximal–distal regulatory interactions that establish and maintain outgrowth of the vertebrate limb. Mercader et al. (1999) described the role of homeo box genes Meis1, Meis2, and Pbx1 (OMIM Ref. No. 176310) in the development of mouse, chicken, and Drosophila limbs. Mercader et al. (1999) found that Meis1 and Meis2 expression is restricted to the proximal domain, coincident with the previously reported domain in which Pbx1 is localized to the nucleus. Meis1 regulates Pbx1 activity by promoting nuclear import of the Pbx1 protein. Mercader et al. (1999) also demonstrated that ectopic expression of Meis1 in chicken disrupts distal limb development and induces distal-to-proximal transformations. Mercader et al. (1999) concluded that the restriction of Meis1 to proximal regions of the vertebrate limb is essential to specify cell fates and differentiation patterns along the proximodistal axis of the limb.

[44466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44467] Capdevila, J.; Tsukui, T.; Esteban, C. R.; Zappavigna, V.;

Belmonte, J. C. I. : Control of vertebrate limb outgrowth by the proximal factor Meis2 and distal antagonism of BMPs by Gremlin. *Molec. Cell* 4: 839–849, 1999. ; and

[44468] Mercader, N.; Leonardo, E.; Azpiazu, N.; Serrano, A.; Morata, G.; Martinez–A, C.; Torres, M. : Conserved regulation of proximodistal limb axis development by Meis1/Hth. *Nature* 402: 425.

[44469] Further studies establishing the function and utilities of MEIS2 are found in John Hopkins OMIM database record ID 601740, and in cited publications numbered 9329, 10366–933 and 9405 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564D172 (Accession NM_032042) is another VGAM1244 host target gene. DKFZP564D172 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D172 BINDING SITE, designated SEQ ID:25751, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44470] Another function of VGAM1244 is therefore inhibition of DKFZP564D172 (Accession NM_032042). Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D172. HSMPP8 (Accession XM_167894) is another VGAM1244 host target gene. HSMPP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44901, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44471] Another function of VGAM1244 is therefore inhibition of HSMPP8 (Accession XM_167894). Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. Leucine-rich Repeat LGI Family, Member 4 (LGI4, Accession NM_139284) is another VGAM1244 host target gene. LGI4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LGI4, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI4 BINDING SITE, designated SEQ ID:29287, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44472] Another function of VGAM1244 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 4 (LGI4, Accession NM_139284). Accordingly, utilities of VGAM1244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI4. Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM_002748) is another VGAM1244 host target gene. MAPK6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAPK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK6 BINDING SITE, designated SEQ ID:8625, to the nucleotide sequence of VGAM1244 RNA, herein designated VGAM RNA, also designated SEQ ID:3955.

[44473] Another function of VGAM1244 is therefore inhibition of Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM_002748). Accordingly, utilities of VGAM1244 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK6. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1245 (VGAM1245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44474] VGAM1245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1245 was detected is described hereinabove with reference to Figs. 1–8.

[44475] VGAM1245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3. VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44476] VGAM1245 gene encodes a VGAM1245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1245 precursor RNA is desig-

nated SEQ ID:1231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1231 is located at position 19532 relative to the genome of Turkey Adenovirus 3.

- [44477] VGAM1245 precursor RNA folds onto itself, forming VGAM1245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44478] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1245 folded precursor RNA into VGAM1245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1245 RNA is designated SEQ ID:3956, and is provided hereinbelow with reference to the sequence

listing part.

[44479] VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1245 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44480] VGAM1245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1245 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1245 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44481] The complementary binding of VGAM1245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1245 host target RNA into VGAM1245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44482] It is appreciated that VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1245 host target genes. The mRNA of each one of this plurality of VGAM1245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1245 RNA, herein designated VGAM

RNA, and which when bound by VGAM1245 RNA causes inhibition of translation of respective one or more VGAM1245 host target proteins.

[44483] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1245 gene, herein designated VGAM GENE, on one or more VGAM1245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44484] It is yet further appreciated that a function of VGAM1245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1245 include diagnosis, prevention and treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM1245 correlate with, and may be deduced from, the identity of the host target genes which VGAM1245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44485] Nucleotide sequences of the VGAM1245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1245 are further described hereinbelow with reference to Table 1.

[44486] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1245 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44487] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1245 gene, herein designated VGAM is

inhibition of expression of VGAM1245 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1245 correlate with, and may be deduced from, the identity of the target genes which VGAM1245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44488] Arylsulfatase D (ARSD, Accession NM_009589) is a VGAM1245 host target gene. ARSD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARSD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARSD BINDING SITE, designated SEQ ID:14316, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44489] A function of VGAM1245 is therefore inhibition of Arylsulfatase D (ARSD, Accession NM_009589), a gene which hydrolyzes sulfate groups from sugar residues in complex glycoconjugates. Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARSD. The function of ARSD and its association with various diseases and clinical

conditions, has been established by previous studies, as described hereinabove with reference to VGAM232.V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM_005235) is another VGAM1245 host target gene. ERBB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERBB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB4 BINDING SITE, designated SEQ ID:11746, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44490] Another function of VGAM1245 is therefore inhibition of V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM_005235), a gene which may function in growth/differentiation of normal and transformed cells. Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB4. The function of ERBB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM381.Galanin Receptor 1 (GALR1, Accession NM_001480) is another VGAM1245 host target gene. GALR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALR1 BINDING SITE, designated SEQ ID:7215, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44491] Another function of VGAM1245 is therefore inhibition of Galanin Receptor 1 (GALR1, Accession NM_001480), a gene which plays a role in regulating ion transport. Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALR1. The function of GALR1 has been established by previous studies. Galanin (OMIM Ref. No. 137035) is an important neuromodulator present in the brain, gastrointestinal system, and hypothalamopituitary axis. It is a 30-amino acid non-C-terminally amidated peptide that potently stimulates growth hormone secretion, inhibits cardiac vagal slowing of heart rate, abolishes

sinus arrhythmia, and inhibits postprandial gastrointestinal motility. The actions of galanin are mediated through interaction with specific membrane receptors that are members of the 7-transmembrane family of G protein-coupled receptors. Walli et al. (1994) identified and biochemically characterized a specific receptor for galanin in various areas of human brain. Habert-Ortoli et al. (1994) also cloned a functional human galanin receptor. Hecht et al. (1999) showed that pathogenic *E. coli*, but not normal commensal organisms, increase GALR1, which they called GAL1R, mRNA synthesis and (125)I-galanin binding sites. In mice infected with enterohemorrhagic *E. coli* by gavage, infection caused a progressive increase in both nuclear factor kappa-B (see OMIM Ref. No. 164011) activation and GALR1 expression, with maximal levels of both observed 3 days after gavage. With Ussing chamber studies, they showed that colons infected with enterohemorrhagic *E. coli*, but not those exposed to normal colonic flora, markedly increased short-circuit current in response to galanin. These data indicated that pathogen-induced increases in GALR1 expression by epithelial cells lining the colon represent a novel unifying pathway responsible for at least a portion of the excessive fluid secretion observed

during infectious diarrhea.

[44492] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44493] Hecht, G.; Marrero, J. A.; Danilkovich, A.; Matkowskyj, K. A.; Savkovic, S. D.; Koutsouris, A.; Benya, R. V. : Pathogenic *Escherichia coli* increase Cl⁻ secretion from intestinal epithelia by upregulating galanin-1 receptor expression. *J. Clin. Invest.* 104: 253-262, 1999. ; and

[44494] Jacoby, A. S.; Webb, G. C.; Liu, M. L.; Kofler, B.; Hort, Y. J.; Fathi, Z.; Bottema, C. D. K.; Shine, J.; Iismaa, T. P. : Structural organization of the mouse and human GALR1 galanin r.

[44495] Further studies establishing the function and utilities of GALR1 are found in John Hopkins OMIM database record ID 600377, and in cited publications numbered 1627-1629, 1025 and 10376-10380 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10204 (Accession NM_018024) is another VGAM1245 host target gene. FLJ10204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10204, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10204 BINDING SITE, designated SEQ ID:19765, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44496] Another function of VGAM1245 is therefore inhibition of FLJ10204 (Accession NM_018024). Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10204. FLJ21272 (Accession NM_025032) is another VGAM1245 host target gene. FLJ21272 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21272 BINDING SITE, designated SEQ ID:24629, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44497] Another function of VGAM1245 is therefore inhibition of FLJ21272 (Accession NM_025032). Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ21272. KIAA0461 (Accession XM_047883) is another VGAM1245 host target gene. KIAA0461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0461 BINDING SITE, designated SEQ ID:35072, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44498] Another function of VGAM1245 is therefore inhibition of KIAA0461 (Accession XM_047883). Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0461. LOC150139 (Accession XM_086794) is another VGAM1245 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38858, to the nucleotide sequence of VGAM1245 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:3956.

[44499] Another function of VGAM1245 is therefore inhibition of LOC150139 (Accession XM_086794). Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. LOC150481 (Accession XM_086929) is another VGAM1245 host target gene. LOC150481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150481 BINDING SITE, designated SEQ ID:38978, to the nucleotide sequence of VGAM1245 RNA, herein designated VGAM RNA, also designated SEQ ID:3956.

[44500] Another function of VGAM1245 is therefore inhibition of LOC150481 (Accession XM_086929). Accordingly, utilities of VGAM1245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150481. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1246 (VGAM1246) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44501] VGAM1246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1246 was detected is described hereinabove with reference to Figs. 1–8.

[44502] VGAM1246 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Turkey Adenovirus 3. VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44503] VGAM1246 gene encodes a VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1246 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1246 precursor RNA is designated SEQ ID:1232, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1232 is located at position 24059 relative to the genome of Turkey Adenovirus 3.

[44504] VGAM1246 precursor RNA folds onto itself, forming

VGAM1246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44505] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1246 folded precursor RNA into VGAM1246 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1246 RNA is designated SEQ ID:3957, and is provided hereinbelow with reference to the sequence listing part.

[44506] VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1246 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44507] VGAM1246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1246 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44508] The complementary binding of VGAM1246 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1246 host target RNA into VGAM1246 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44509] It is appreciated that VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1246 host target genes. The mRNA of each one of this plurality of VGAM1246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1246 RNA, herein designated VGAM RNA, and which when bound by VGAM1246 RNA causes inhibition of translation of respective one or more VGAM1246 host target proteins.

[44510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1246 gene, herein designated VGAM GENE, on one or more VGAM1246 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44511] It is yet further appreciated that a function of VGAM1246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of viral infection by Turkey Adenovirus 3. Specific functions, and accordingly utilities, of VGAM1246 correlate with, and may be deduced from, the identity of the host target genes which VGAM1246 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[44512] Nucleotide sequences of the VGAM1246 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1246 are further described hereinbelow with reference to Table 1.

[44513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1246 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44514] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1246 gene, herein designated VGAM is inhibition of expression of VGAM1246 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1246 correlate with, and may be deduced from, the identity of the target genes which VGAM1246 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[44515] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 12 (ABCC12, Accession NM_033226) is a VGAM1246 host target gene. ABCC12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC12 BINDING SITE, designated SEQ ID:27073, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44516] A function of VGAM1246 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 12 (ABCC12, Accession NM_033226), a gene which acts as a multispecific organic anion pump which can transport nucleotide analogs (by similarity). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC12. The function of ABCC12 has been established by previous studies. Tammur et al. (2001) identified ABCC12 and ABCC11 (OMIM Ref. No. 607040) by database analysis using ABC transporter sequences as queries. The deduced

1,359–amino acid ABCC12 protein contains 2 ATP–binding domains and 2 transmembrane regions. It shares 42% amino acid sequence identity with ABCC5 (OMIM Ref. No. 605251). PCR of a 16–tissue panel revealed expression only in testis, ovary, and prostate. Bera et al. (2002) detected expression in testis, pancreas, ovary, skeletal muscle, and various brain regions. Northern blot and dot blot analyses using variant–specific probes revealed a 4.5–kb transcript expressed in testis, normal breast, and breast cancer tissues, and a 1.3–kb transcript in brain, skeletal muscle, and ovary. In situ hybridization of normal and cancerous breast tissue revealed stronger staining in tumor cells. Tammur et al. (2001) mapped the ABCC12 gene to chromosome 16q12.1 by radiation hybrid analysis and by the presence of ABCC12 within a BAC clone. They stated that chromosomal localization, potential function, and expression profiles of the ABCC11 and ABCC12 genes make them promising candidates for paroxysmal kinesigenic choreoathetosis (PKC; 128200) and infantile convulsions with paroxysmal choreoathetosis (ICCA; 602066).

[44517] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [44518] Tammur, J.; Prades, C.; Arnould, I.; Rzhetsky, A.; Hutchinson, A.; Adachi, M.; Schuetz, J. D.; Swoboda, K. J.; Ptacek, L. J.; Rosier, M.; Dean, M.; Allikmets, R. : Two new genes from the human ATP-binding cassette transporter superfamily, ABCC11 and ABCC12, tandemly duplicated on chromosome 16q12. *Gene* 273: 89–96, 2001. ; and
- [44519] Bera, T. K.; Iavarone, C.; Kumar, V.; Lee, S.; Lee, B.; Pastan, I. : MRP9, an unusual truncated member of the ABC transporter superfamily, is highly expressed in breast cancer. *Proc. Natl. Acad. Sci. USA* 98: 1051–1056, 2001.
- [44520] Further studies establishing the function and utilities of ABCC12 are found in John Hopkins OMIM database record ID 607041, and in cited publications numbered 5171–5166 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Beclin 1 (coiled-coil, myosin-like BCL2 interacting protein) (BECN1, Accession NM_003766) is another VGAM1246 host target gene. BECN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BECN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BECN1 BINDING SITE, designated SEQ

ID:9843, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44521] Another function of VGAM1246 is therefore inhibition of Beclin 1 (coiled-coil, myosin-like BCL2 interacting protein) (BECN1, Accession NM_003766), a gene which protects cell from viral-induced apoptosis. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BECN1. The function of BECN1 has been established by previous studies. The process of autophagy, or bulk degradation of cellular proteins through an autophagosomic-lysosomal pathway, is important in normal growth control and may be defective in tumor cells. However, little is known about the genetic mediators of autophagy in mammalian cells or their role in tumor development. Beclin-1 was found to have structural similarity to the yeast autophagy gene, *apg6/vps30*, and is monoallelically deleted in 40 to 75% of sporadic human breast cancers and ovarian cancers. Liang et al. (1999) used gene transfer techniques to demonstrate that beclin-1 promotes autophagy in autophagy-defective yeast with a targeted disruption of *apg6/vps30*, and in human MCF7 breast carcinoma cells. The au-

tophagy-promoting activity of beclin-1 in MCF7 cells was associated with inhibition of MCF7 cellular proliferation, in vitro clonogenicity, and tumorigenesis in nude mice. Furthermore, endogenous beclin-1 protein expression is frequently low in human breast epithelial carcinoma cell lines and tissue, but is ubiquitous at high levels in normal breast epithelia. Thus, Liang et al. (1999) concluded that beclin-1 is a mammalian autophagy gene that can inhibit tumorigenesis and is expressed at decreased levels in human breast carcinoma. Liang et al. (1999) suggested that decreased expression of autophagy proteins may contribute to the development or progression of breast and other human malignancies. Short leucine-rich nuclear export signals (NESs), which were first identified in the human immunodeficiency virus-1 (HIV-1) Rev protein, are found in viral and cellular proteins required for RNA export. The NES forms a complex with CRM1 (OMIM Ref. No. 602559), the nuclear export receptor, and RanGTP (see OMIM Ref. No. 602362). Complex formation can be blocked by the fungicide leptomycin B. By structural analysis, Liang et al. (2001) identified an NES at positions 180 to 189 in BECN1. Fluorescence microscopy demonstrated nuclear and cytoplasmic expression of wildtype BECN1,

while leptomycin B-treated BECN1 or BECN1 carrying leucine mutations in its NES were expressed only in the nucleus. Mutant BECN1 was unable to promote basal or nutrient deprivation-induced autophagy and was unable to suppress growth of breast cancer cells in vitro or in vivo. Liang et al. (2001) suggested that the nuclear export pathway may be important in the functional regulation of autophagic growth control.

[44522] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44523] Liang, X. H.; Jackson, S.; Seaman, M.; Brown, K.; Kempkes, B.; Hibshoosh, H.; Levine, B. : Induction of autophagy and inhibition of tumorigenesis by beclin 1. Nature 402: 672–676, 1999. ; and

[44524] Liang, X. H.; Yu, J.; Brown, K.; Levine, B. : Beclin 1 contains a leucine-rich nuclear export signal that is required for its autophagy and tumor suppressor function. Cancer Res. 61: 34.

[44525] Further studies establishing the function and utilities of BECN1 are found in John Hopkins OMIM database record ID 604378, and in cited publications numbered 7073–7076 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Cysteine Dioxygenase, Type I (CDO1, Accession NM_001801) is another VGAM1246 host target gene. CDO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDO1 BINDING SITE, designated SEQ ID:7556, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44526] Another function of VGAM1246 is therefore inhibition of Cysteine Dioxygenase, Type I (CDO1, Accession NM_001801), a gene which is involved in degradation of cysteine to pyruvate. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDO1. The function of CDO1 has been established by previous studies. The first step in the oxidation of cysteine to inorganic sulphate is its conversion to cysteine sulphinate by cysteine dioxygenase (CDO; EC 1.13.11.20). In rat, at least 2 enzymes catalyze this reaction, one cytosolic (CDO-I) and the other membrane-bound. Rat liver CDO contains 1

atom of iron per molecule of protein, and the enzyme is activated by anaerobic incubation with either L-cysteine or its analogs. Hosokawa et al. (1990) isolated rat liver cDNAs encoding the cytosolic CDO. The protein's predicted molecular weight of 23 kD was in good agreement with its apparent molecular mass by SDS-PAGE. By screening a human liver library with a rat CDO-I cDNA, McCann et al. (1994) identified human CDO-I cDNAs. The predicted 200-amino acid human and rat proteins are 94% identical. Northern blot analysis revealed that CDO-I is expressed as an approximately 1.5-kb mRNA in liver. Ramsden et al. (1997) reported that the human CDO-I gene contains 5 exons and spans more than 12 kb. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, Jeremiah et al. (1996) mapped the CDO1 gene to human chromosome 5q22-q23. Using an interspecific backcross, these authors mapped the mouse homolog to the central region of mouse chromosome 18, in a region sharing homology of synteny with human chromosome 5.

[44527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44528] Hosokawa, Y.; Matsumoto, A.; Oka, J.; Itakura, H.; Yam-

aguchi, K. : Isolation and characterization of a cDNA for rat liver cysteine dioxygenase. Biochem. Biophys. Res. Commun. 168: 473–478, 1990. ; and

[44529] Jeremiah, S.; McCann, K. P.; Williams, A. C.; Ramsden, D. B.; Pilz, A. J.; Fox, M. F.; Povey, S. : Chromosomal localisation of genes coding for human and mouse liver cytosolic cysteine.

[44530] Further studies establishing the function and utilities of CDO1 are found in John Hopkins OMIM database record ID 603943, and in cited publications numbered 5192–519 and 5169 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Drebrin 1 (DBN1, Accession NM_004395) is another VGAM1246 host target gene. DBN1 BINDING SITE1 and DBN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DBN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DBN1 BINDING SITE1 and DBN1 BINDING SITE2, designated SEQ ID:10640 and SEQ ID:28125 respectively, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44531] Another function of VGAM1246 is therefore inhibition of Drebrin 1 (DBN1, Accession NM_004395). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DBN1. FUS1 (Accession NM_007275) is another VGAM1246 host target gene. FUS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUS1 BINDING SITE, designated SEQ ID:14138, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44532] Another function of VGAM1246 is therefore inhibition of FUS1 (Accession NM_007275), a gene which may function as a tumor suppressor. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUS1. The function of FUS1 has been established by previous studies. Lerman and Minna (2000) identified a FUS1 mutation in 2 nonsmall cell lung cancer (NSCLC) cell lines that resulted in a 28-bp truncation at the 3-prime end of exon

2 and a predicted protein of only 82 amino acids. Using SSCP and CpG island promoter methylation analyses, Kondo et al. (2001) failed to detect mutations, polymorphisms, or methylation of FUS1 in lung cancer specimens. Western blot analysis indicated low or no expression of FUS1 in lung cancer cell lines. Overexpression of transfected wildtype but not mutant FUS1 in NSCLCs led to the detection of an approximately 20-kD protein and a dramatic reduction in colony-forming cells. Ecdysone-induced expression of FUS1 had the same effects. Flow cytometric analysis indicated that the arrest occurred in G1 phase.

[44533] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44534] Kondo, M.; Ji, L.; Kamibayashi, C.; Tomizawa, Y.; Randle, D.; Sekido, Y.; Yokota, J.; Kashuba, V.; Zabarovsky, E.; Kuzmin, I.; Lerman, M.; Roth, J.; Minna, J. D. : Overexpression of candidate tumor suppressor gene FUS1 isolated from the 3p21.3 homozygous deletion region leads to G1 arrest and growth inhibition of lung cancer cells. *Oncogene* 20: 6258–6262, 2001. ; and

[44535] Lerman, M. I.; Minna, J. D. : The 630-kb lung cancer ho-

mozygous deletion region on human chromosome 3p21.3: identification and evaluation of the resident candidate tumor suppressor gen.

[44536] Further studies establishing the function and utilities of FUS1 are found in John Hopkins OMIM database record ID 607052, and in cited publications numbered 5388 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 4, Regulatory Subunit 1 (PPP4R1, Accession NM_005134) is another VGAM1246 host target gene. PPP4R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP4R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R1 BINDING SITE, designated SEQ ID:11610, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44537] Another function of VGAM1246 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 1 (PPP4R1, Accession NM_005134). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R1. Retinoic

Acid Induced 3 (RAI3, Accession NM_003979) is another VGAM1246 host target gene. RAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI3 BINDING SITE, designated SEQ ID:10113, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44538] Another function of VGAM1246 is therefore inhibition of Retinoic Acid Induced 3 (RAI3, Accession NM_003979). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI3. Transcription Factor 19 (SC1) (TCF19, Accession XM_175167) is another VGAM1246 host target gene. TCF19 BINDING SITE1 and TCF19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TCF19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF19 BINDING SITE1 and TCF19 BINDING SITE2, desig-

nated SEQ ID:46660 and SEQ ID:46709 respectively, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44539] Another function of VGAM1246 is therefore inhibition of Transcription Factor 19 (SC1) (TCF19, Accession XM_175167), a gene which plays an important role in the transcription of genes required for the later stages of cell cycle progression. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF19. The function of TCF19 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299. UPF3A (Accession NM_023011) is another VGAM1246 host target gene. UPF3A BINDING SITE1 and UPF3A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UPF3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPF3A BINDING SITE1 and UPF3A BINDING SITE2, designated SEQ ID:23275 and SEQ ID:33765 respectively, to the nucleotide sequence of VGAM1246 RNA,

herein designated VGAM RNA, also designated SEQ ID:3957.

[44540] Another function of VGAM1246 is therefore inhibition of UPF3A (Accession NM_023011), a gene which facilitates the export of spliced mRNAs by recruiting mRNA export proteins. Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPF3A. The function of UPF3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM360.FLJ12747 (Accession NM_032173) is another VGAM1246 host target gene. FLJ12747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ ID:25881, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44541] Another function of VGAM1246 is therefore inhibition of FLJ12747 (Accession NM_032173). Accordingly, utilities of

VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747. FLJ20313 (Accession NM_017762) is another VGAM1246 host target gene. FLJ20313 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20313 BINDING SITE, designated SEQ ID:19377, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44542] Another function of VGAM1246 is therefore inhibition of FLJ20313 (Accession NM_017762). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20313. KIAA0237 (Accession NM_014747) is another VGAM1246 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0237 BINDING SITE, designated SEQ ID:16449, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44543] Another function of VGAM1246 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. Ring Finger Protein 10 (RNF10, Accession NM_014868) is another VGAM1246 host target gene. RNF10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF10 BINDING SITE, designated SEQ ID:16964, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44544] Another function of VGAM1246 is therefore inhibition of Ring Finger Protein 10 (RNF10, Accession NM_014868). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF10. Solute Carrier Family 31

(copper transporters), Member 2 (SLC31A2, Accession XM_011776) is another VGAM1246 host target gene. SLC31A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC31A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC31A2 BINDING SITE, designated SEQ ID:30194, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44545] Another function of VGAM1246 is therefore inhibition of Solute Carrier Family 31 (copper transporters), Member 2 (SLC31A2, Accession XM_011776). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC31A2. LOC115297 (Accession XM_053313) is another VGAM1246 host target gene. LOC115297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC115297 BINDING SITE, designated SEQ ID:36074, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44546] Another function of VGAM1246 is therefore inhibition of LOC115297 (Accession XM_053313). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115297. LOC115817 (Accession NM_138452) is another VGAM1246 host target gene. LOC115817 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115817 BINDING SITE, designated SEQ ID:28814, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44547] Another function of VGAM1246 is therefore inhibition of LOC115817 (Accession NM_138452). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115817. LOC126755 (Accession XM_059074) is another VGAM1246 host target gene. LOC126755 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126755, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126755 BINDING SITE, designated SEQ ID:36858, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44548] Another function of VGAM1246 is therefore inhibition of LOC126755 (Accession XM_059074). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126755. LOC200014 (Accession XM_114087) is another VGAM1246 host target gene. LOC200014 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200014 BINDING SITE, designated SEQ ID:42692, to the nucleotide sequence of VGAM1246 RNA, herein designated VGAM RNA, also designated SEQ ID:3957.

[44549] Another function of VGAM1246 is therefore inhibition of

LOC200014 (Accession XM_114087). Accordingly, utilities of VGAM1246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1247 (VGAM1247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44550] VGAM1247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1247 was detected is described hereinabove with reference to Figs. 1-8.

[44551] VGAM1247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44552] VGAM1247 gene encodes a VGAM1247 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1247 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1247 precursor RNA is designated SEQ ID:1233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1233 is located at position 132081 relative to the genome of Monkeypox Virus.

- [44553] VGAM1247 precursor RNA folds onto itself, forming VGAM1247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44554] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1247 folded precursor RNA into VGAM1247 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM1247 RNA is designated SEQ ID:3958, and is provided hereinbelow with reference to the sequence listing part.

[44555] VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1247 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44556] VGAM1247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1247 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[44557] The complementary binding of VGAM1247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1247 host target RNA into VGAM1247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44558] It is appreciated that VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1247 host target genes. The mRNA of each one of this plurality of VGAM1247 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1247 RNA, herein designated VGAM RNA, and which when bound by VGAM1247 RNA causes inhibition of translation of respective one or more VGAM1247 host target proteins.

[44559] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1247 gene, herein designated VGAM GENE, on one or more VGAM1247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44560] It is yet further appreciated that a function of VGAM1247

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1247 correlate with, and may be deduced from, the identity of the host target genes which VGAM1247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44561] Nucleotide sequences of the VGAM1247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1247 are further described hereinbelow with reference to Table 1.

[44562] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1247 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44563] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1247 gene, herein designated VGAM is inhibition of expression of VGAM1247 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1247 correlate with, and may be deduced from, the identity of the target genes which VGAM1247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44564] Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027) is a VGAM1247 host target gene. ANKH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKH BINDING SITE, designated SEQ ID:27638, to the nucleotide sequence of VGAM1247 RNA, herein designated VGAM RNA, also designated SEQ ID:3958.

[44565] A function of VGAM1247 is therefore inhibition of Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM_054027), a gene which regulates intra- and extracellular levels of inorganic pyrophosphate (ppi), probably functioning as ppi transporter. Accordingly, utilities of

VGAM1247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKH. The function of ANKH has been established by previous studies. Craniometaphyseal dysplasia (CMD; 123000) is a bone dysplasia characterized by overgrowth and sclerosis of the craniofacial bones and abnormal modeling of the metaphyses of the tubular bones. Hyperostosis and sclerosis of the skull may lead to cranial nerve compressions resulting in hearing loss and facial palsy. An autosomal dominant form of the disorder was mapped to 5p15.2–p14.1 (Nurnberg et al., 1997) within a region harboring the human homolog (ANKH) of the mouse progressive ankylosis (ank) gene. The ANK protein spans the outer cell membrane and shuttles inorganic pyrophosphate, a major inhibitor of physiologic and pathologic calcification, bone mineralization, and bone resorption. Nurnberg et al. (2001) identified 6 different mutations in the ANKH gene in 8 of 9 families with CMD. The mutations predicted single amino acid substitutions, deletions, or insertions. Using a helix prediction program, they proposed for the ANK molecule 12 membrane-spanning helices with an alternate inside/out orientation and a central channel permitting the passage of inorganic pyrophos-

phate. The mutations occurred at highly conserved amino acid residues presumed to be located in the cytosolic portion of the protein. The results linked the inorganic pyrophosphate channel ANK with bone formation and remodeling. Animal model experiments lend further support to the function of ANKH. Mice carrying the progressive ankylosis mutation have been studied as a model of arthritis. The autosomal recessive Ank mutation causes an abnormal flat-footed gait in young mice due to decreased mobility of ankle and toe joints. Loss of joint mobility becomes more severe with age and spreads to most joints throughout the limbs and vertebral column leading to complete rigidity and death around 6 months of age. Hydroxyapatite crystals develop in articular surfaces and synovial fluid of Ank mice, accompanied by joint space narrowing, cartilage erosion, and formation of bony outgrowths or osteophytes that cause fusion (ankylosis) and joint immobility. Ho et al. (2000) identified a G-to-T substitution in the mouse Ank gene, leading to a nonsense mutation in exon 11, the penultimate exon of mouse Ank. This mutation truncates the C-terminal region of the protein and greatly reduces its activity in vitro. The mouse Ank gene is expressed in developing articular surfaces

and may help maintain the unmineralized state by providing a local source of inorganic pyrophosphate to inhibit hydroxyapatite formation. In the absence of normal Ank activity, mineralization extends unhindered throughout articular cartilage, hydroxyapatite deposits form in synovial fluid, and new bone is deposited in and around joints, showing that the gene is essential for normal joint maintenance.

[44566] It is appreciated that the abovementioned animal model for ANKH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[44567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44568] Ho, A. M.; Johnson, M. D.; Kingsley, D. M. : Role of the mouse ank gene in control of tissue calcification and arthritis. Science 289: 265–270, 2000. ; and

[44569] Nurnberg, P.; Tinschert, S.; Mrug, M.; Hampe, J.; Muller, C. R.; Fuhrmann, E.; Braun, H.–S.; Reis, A. : The gene for autosomal dominant craniometaphyseal dysplasia maps to chromosome 5q.

[44570] Further studies establishing the function and utilities of

ANKH are found in John Hopkins OMIM database record ID 605145, and in cited publications numbered 2877, 3552–355 and 7300 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Beta 4 (PCDHB4, Accession NM_018938) is another VGAM1247 host target gene. PCDHB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDHB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB4 BINDING SITE, designated SEQ ID:21005, to the nucleotide sequence of VGAM1247 RNA, herein designated VGAM RNA, also designated SEQ ID:3958.

[44571] Another function of VGAM1247 is therefore inhibition of Protocadherin Beta 4 (PCDHB4, Accession NM_018938). Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB4. Zinc Finger Protein 266 (ZNF266, Accession XM_113992) is another VGAM1247 host target gene. ZNF266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by ZNF266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF266 BINDING SITE, designated SEQ ID:42598, to the nucleotide sequence of VGAM1247 RNA, herein designated VGAM RNA, also designated SEQ ID:3958.

[44572] Another function of VGAM1247 is therefore inhibition of Zinc Finger Protein 266 (ZNF266, Accession XM_113992). Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF266. KIAA0293 (Accession XM_027045) is another VGAM1247 host target gene. KIAA0293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0293 BINDING SITE, designated SEQ ID:30391, to the nucleotide sequence of VGAM1247 RNA, herein designated VGAM RNA, also designated SEQ ID:3958.

[44573] Another function of VGAM1247 is therefore inhibition of

KIAA0293 (Accession XM_027045). Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0293. LOC163026 (Accession XM_091942) is another VGAM1247 host target gene. LOC163026 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163026 BINDING SITE, designated SEQ ID:40071, to the nucleotide sequence of VGAM1247 RNA, herein designated VGAM RNA, also designated SEQ ID:3958.

[44574] Another function of VGAM1247 is therefore inhibition of LOC163026 (Accession XM_091942). Accordingly, utilities of VGAM1247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1248 (VGAM1248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[44575] VGAM1248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1248 was detected is described hereinabove with reference to Figs. 1–8.

[44576] VGAM1248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44577] VGAM1248 gene encodes a VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1248 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1248 precursor RNA is designated SEQ ID:1234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1234 is located at position 131818 relative to the genome of Monkeypox Virus.

[44578] VGAM1248 precursor RNA folds onto itself, forming VGAM1248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1248 folded precursor RNA into VGAM1248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM1248 RNA is designated SEQ ID:3959, and is provided hereinbelow with reference to the sequence listing part.

[44580] VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1248 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44581] VGAM1248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1248 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[44582] The complementary binding of VGAM1248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1248 host target RNA into VGAM1248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44583] It is appreciated that VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1248 host target genes. The mRNA of each one of this plurality of VGAM1248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1248 RNA, herein designated VGAM RNA, and which when bound by VGAM1248 RNA causes inhibition of translation of respective one or more VGAM1248 host target proteins.

[44584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1248 gene, herein designated VGAM GENE, on one

or more VGAM1248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44585] It is yet further appreciated that a function of VGAM1248 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1248 correlate with, and may be deduced from, the identity of the host target genes which VGAM1248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44586] Nucleotide sequences of the VGAM1248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1248 are further described hereinbelow with reference to Table 1.

[44587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1248 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1248 gene, herein designated VGAM is inhibition of expression of VGAM1248 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1248 correlate with, and may be deduced from, the identity of the target genes which VGAM1248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44589] BDG-29 (Accession XM_051343) is a VGAM1248 host tar-

get gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:35816, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44590] A function of VGAM1248 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940) is another VGAM1248 host target gene. C21orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf6 BINDING SITE, designated SEQ ID:18855, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ

ID:3959.

[44591] Another function of VGAM1248 is therefore inhibition of Chromosome 21 Open Reading Frame 6 (C21orf6, Accession NM_016940). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf6. DKFZp434D177 (Accession NM_032264) is another VGAM1248 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:26007, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44592] Another function of VGAM1248 is therefore inhibition of DKFZp434D177 (Accession NM_032264). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434D177. HSA249128 (Accession NM_017583) is another VGAM1248 host target gene. HSA249128

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA249128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA249128 BINDING SITE, designated SEQ ID:19027, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44593] Another function of VGAM1248 is therefore inhibition of HSA249128 (Accession NM_017583). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA249128. KIAA1634 (Accession XM_032749) is another VGAM1248 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31751, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44594] Another function of VGAM1248 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1941 (Accession XM_059318) is another VGAM1248 host target gene. KIAA1941 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1941, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1941 BINDING SITE, designated SEQ ID:36951, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44595] Another function of VGAM1248 is therefore inhibition of KIAA1941 (Accession XM_059318). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1941. PRO2533 (Accession NM_018629) is another VGAM1248 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:20702, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44596] Another function of VGAM1248 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM_098021) is another VGAM1248 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41323, to the nucleotide sequence of VGAM1248 RNA, herein designated VGAM RNA, also designated SEQ ID:3959.

[44597] Another function of VGAM1248 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM1248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1249 (VGAM1249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44598] VGAM1249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1249 was detected is described hereinabove with reference to Figs. 1–8.

[44599] VGAM1249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44600] VGAM1249 gene encodes a VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1249 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1249 precursor RNA is designated SEQ ID:1235, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1235 is located at position 130478 relative to the genome of Monkeypox Virus.

- [44601] VGAM1249 precursor RNA folds onto itself, forming VGAM1249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44602] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1249 folded precursor RNA into VGAM1249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1249 RNA is designated SEQ ID:3960, and is provided hereinbelow with reference to the sequence listing part.

[44603] VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1249 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44604] VGAM1249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1249 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[44605] The complementary binding of VGAM1249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1249 host target RNA into VGAM1249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44606] It is appreciated that VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1249 host target genes. The mRNA of each one of this plurality of VGAM1249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1249 RNA, herein designated VGAM RNA, and which when bound by VGAM1249 RNA causes

inhibition of translation of respective one or more VGAM1249 host target proteins.

[44607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1249 gene, herein designated VGAM GENE, on one or more VGAM1249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44608] It is yet further appreciated that a function of VGAM1249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1249 include diagnosis, prevention and

treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1249 correlate with, and may be deduced from, the identity of the host target genes which VGAM1249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44609] Nucleotide sequences of the VGAM1249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1249 are further described hereinbelow with reference to Table 1.

[44610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1249 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44611] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1249 gene, herein designated VGAM is inhibition of expression of VGAM1249 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1249 correlate with, and may be deduced from, the identity of the target genes which VGAM1249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44612] Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548) is a VGAM1249 host target gene. BPAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BPAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BPAG1 BINDING SITE, designated SEQ ID:17811, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44613] A function of VGAM1249 is therefore inhibition of Bullous Pemphigoid Antigen 1, 230/240kDa (BPAG1, Accession NM_015548), a gene which plays a role in cross-linking actin to other cytoskeletal proteins, binds to microtubules. Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BPAG1. The function of BPAG1 and

its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM494.CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838) is another VGAM1249 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36189, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44614] Another function of VGAM1249 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM_054838). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. KIAA1987 (Accession XM_113870) is another VGAM1249 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42501, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44615] Another function of VGAM1249 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469) is another VGAM1249 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25532, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44616] Another function of VGAM1249 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM_031469). Accordingly, utilities

of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC123242 (Accession XM_063548) is another VGAM1249 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37247, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44617] Another function of VGAM1249 is therefore inhibition of LOC123242 (Accession XM_063548). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC145945 (Accession XM_096908) is another VGAM1249 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC145945 BINDING SITE, designated SEQ ID:40638, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44618] Another function of VGAM1249 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC149013 (Accession XM_086398) is another VGAM1249 host target gene. LOC149013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149013 BINDING SITE, designated SEQ ID:38632, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44619] Another function of VGAM1249 is therefore inhibition of LOC149013 (Accession XM_086398). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149013. LOC253001 (Accession XM_171711) is another VGAM1249 host target gene. LOC253001 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253001 BINDING SITE, designated SEQ ID:46061, to the nucleotide sequence of VGAM1249 RNA, herein designated VGAM RNA, also designated SEQ ID:3960.

[44620] Another function of VGAM1249 is therefore inhibition of LOC253001 (Accession XM_171711). Accordingly, utilities of VGAM1249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253001. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1250 (VGAM1250) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44621] VGAM1250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1250 was detected is described hereinabove with reference to Figs. 1-8.

[44622] VGAM1250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44623] VGAM1250 gene encodes a VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1250 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1250 precursor RNA is designated SEQ ID:1236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1236 is located at position 136377 relative to the genome of Camelpox Virus.

[44624] VGAM1250 precursor RNA folds onto itself, forming VGAM1250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[44625] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1250 folded precursor RNA into VGAM1250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1250 RNA is designated SEQ ID:3961, and is provided hereinbelow with reference to the sequence listing part.

[44626] VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1250 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44627] VGAM1250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1250 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1250 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44628] The complementary binding of VGAM1250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1250 host target RNA into VGAM1250 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44629] It is appreciated that VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1250 host target genes. The mRNA of each one of this plurality of VGAM1250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1250 RNA, herein designated VGAM RNA, and which when bound by VGAM1250 RNA causes inhibition of translation of respective one or more VGAM1250 host target proteins.

[44630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1250 gene, herein designated VGAM GENE, on one or more VGAM1250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44631] It is yet further appreciated that a function of VGAM1250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1250 correlate with, and may be deduced from, the identity of the host target genes which VGAM1250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44632] Nucleotide sequences of the VGAM1250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1250 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1250 are further described hereinbelow with reference to Table 1.

[44633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1250 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44634] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1250 gene, herein designated VGAM is inhibition of expression of VGAM1250 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1250 correlate with, and may be deduced from, the identity of the target genes which VGAM1250 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44635] Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376) is a VGAM1250 host target gene. GRINL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRINL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRINL1A BINDING SITE, designated SEQ ID:34444, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44636] A function of VGAM1250 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376), a gene which plays a role in the development and function of the mammalian brain. Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINL1A. The function of GRINL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.FHX (Accession NM_018416) is another VGAM1250 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20462, to the nucleotide sequence of VGAM1250 RNA, herein

designated VGAM RNA, also designated SEQ ID:3961.

[44637] Another function of VGAM1250 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ13611 (Accession NM_024941) is another VGAM1250 host target gene. FLJ13611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13611 BINDING SITE, designated SEQ ID:24486, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44638] Another function of VGAM1250 is therefore inhibition of FLJ13611 (Accession NM_024941). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13611. KIAA0746 (Accession XM_045277) is another VGAM1250 host target gene. KIAA0746 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0746, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0746 BINDING SITE, designated SEQ ID:34416, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44639] Another function of VGAM1250 is therefore inhibition of KIAA0746 (Accession XM_045277). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0746. KIAA1363 (Accession XM_045056) is another VGAM1250 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34335, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44640] Another function of VGAM1250 is therefore inhibition of KIAA1363 (Accession XM_045056). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1363. LOC220766 (Accession XM_165471) is another VGAM1250 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43655, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44641] Another function of VGAM1250 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221964 (Accession XM_168342) is another VGAM1250 host target gene. LOC221964 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221964 BINDING SITE, designated SEQ ID:45111, to

the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44642] Another function of VGAM1250 is therefore inhibition of LOC221964 (Accession XM_168342). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964. LOC92181 (Accession XM_043394) is another VGAM1250 host target gene. LOC92181 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92181 BINDING SITE, designated SEQ ID:33942, to the nucleotide sequence of VGAM1250 RNA, herein designated VGAM RNA, also designated SEQ ID:3961.

[44643] Another function of VGAM1250 is therefore inhibition of LOC92181 (Accession XM_043394). Accordingly, utilities of VGAM1250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92181. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1251 (VGAM1251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44644] VGAM1251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1251 was detected is described hereinabove with reference to Figs. 1–8.

[44645] VGAM1251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44646] VGAM1251 gene encodes a VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1251 precursor RNA is designated SEQ ID:1237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1237 is located at position 132303 relative to the genome of Monkeypox Virus.

[44647] VGAM1251 precursor RNA folds onto itself, forming VGAM1251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44648] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1251 folded precursor RNA into VGAM1251 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1251 RNA is designated SEQ ID:3962, and is provided hereinbelow with reference to the sequence listing part.

[44649] VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1251 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1251 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44650] VGAM1251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1251 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44651] The complementary binding of VGAM1251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1251 host target RNA into VGAM1251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44652] It is appreciated that VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1251 host target genes. The mRNA of each one of this plurality of VGAM1251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1251 RNA, herein designated VGAM RNA, and which when bound by VGAM1251 RNA causes inhibition of translation of respective one or more VGAM1251 host target proteins.

[44653] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1251 gene, herein designated VGAM GENE, on one or more VGAM1251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44654] It is yet further appreciated that a function of VGAM1251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1251 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44655] Nucleotide sequences of the VGAM1251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1251 are further described hereinbelow with reference to Table 1.

[44656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1251 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44657] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1251 gene, herein designated VGAM is inhibition of expression of VGAM1251 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1251 correlate with, and may be deduced from, the identity of the target genes which VGAM1251

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44658] Dmx-like 1 (DMXL1, Accession NM_005509) is a VGAM1251 host target gene. DMXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMXL1 BINDING SITE, designated SEQ ID:12024, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44659] A function of VGAM1251 is therefore inhibition of Dmx-like 1 (DMXL1, Accession NM_005509). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMXL1. Human T-cell Leukemia Virus Enhancer Factor (HTLF, Accession NM_002158) is another VGAM1251 host target gene. HTLF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTLF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of HTLF BINDING SITE, designated SEQ ID:7933, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44660] Another function of VGAM1251 is therefore inhibition of Human T-cell Leukemia Virus Enhancer Factor (HTLF, Accession NM_002158). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTLF. Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719) is another VGAM1251 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11086, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44661] Another function of VGAM1251 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719), a gene which plays an

essential role in pre-mRNA splicing. Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM700. Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM_007256) is another VGAM1251 host target gene. SLC21A9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A9 BINDING SITE, designated SEQ ID:14129, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44662] Another function of VGAM1251 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM_007256), a gene which is Moderately similar to SLC21A2 prostaglandin transporter. Accordingly, utilities of VGAM1251 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A9. The function of SLC21A9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894. V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465) is another VGAM1251 host target gene. AKT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT3 BINDING SITE, designated SEQ ID:11960, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44663] Another function of VGAM1251 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT3. Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476) is another

VGAM1251 host target gene. BTN2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A1 BINDING SITE, designated SEQ ID:27805, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44664] Another function of VGAM1251 is therefore inhibition of Butyrophilin, Subfamily 2, Member A1 (BTN2A1, Accession NM_078476). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A1. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another VGAM1251 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15581, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3962.

[44665] Another function of VGAM1251 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. DCOHM (Accession NM_032151) is another VGAM1251 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25851, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44666] Another function of VGAM1251 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. FLJ22009 (Accession XM_015700) is another VGAM1251 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30246, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44667] Another function of VGAM1251 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009. KIAA0193 (Accession NM_014766) is another VGAM1251 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16547, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44668] Another function of VGAM1251 is therefore inhibition of KIAA0193 (Accession NM_014766). Accordingly, utilities

of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA1364 (Accession XM_032997) is another VGAM1251 host target gene. KIAA1364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1364 BINDING SITE, designated SEQ ID:31814, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44669] Another function of VGAM1251 is therefore inhibition of KIAA1364 (Accession XM_032997). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1364. Netrin 4 (NTN4, Accession XM_031896) is another VGAM1251 host target gene. NTN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTN4 BIND-

ING SITE, designated SEQ ID:31509, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44670] Another function of VGAM1251 is therefore inhibition of Netrin 4 (NTN4, Accession XM_031896). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTN4. PRO0943 (Accession NM_018568) is another VGAM1251 host target gene. PRO0943 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0943 BINDING SITE, designated SEQ ID:20650, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44671] Another function of VGAM1251 is therefore inhibition of PRO0943 (Accession NM_018568). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0943. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792) is an-

other VGAM1251 host target gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28060, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44672] Another function of VGAM1251 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM_080792). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. LOC147632 (Accession NM_138478) is another VGAM1251 host target gene. LOC147632 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147632 BINDING SITE, designated SEQ ID:28825, to the nucleotide sequence of VGAM1251 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3962.

[44673] Another function of VGAM1251 is therefore inhibition of LOC147632 (Accession NM_138478). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147632. LOC152426 (Accession XM_098225) is another VGAM1251 host target gene. LOC152426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152426 BINDING SITE, designated SEQ ID:41501, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44674] Another function of VGAM1251 is therefore inhibition of LOC152426 (Accession XM_098225). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152426. LOC165741 (Accession XM_105272) is another VGAM1251 host target gene. LOC165741 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165741, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165741 BINDING SITE, designated SEQ ID:42193, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44675] Another function of VGAM1251 is therefore inhibition of LOC165741 (Accession XM_105272). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165741. LOC200728 (Accession XM_117267) is another VGAM1251 host target gene. LOC200728 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200728 BINDING SITE, designated SEQ ID:43343, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44676] Another function of VGAM1251 is therefore inhibition of LOC200728 (Accession XM_117267). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200728. LOC51112 (Accession NM_016030) is another VGAM1251 host target gene. LOC51112 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51112 BINDING SITE, designated SEQ ID:18113, to the nucleotide sequence of VGAM1251 RNA, herein designated VGAM RNA, also designated SEQ ID:3962.

[44677] Another function of VGAM1251 is therefore inhibition of LOC51112 (Accession NM_016030). Accordingly, utilities of VGAM1251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51112. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1252 (VGAM1252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44678] VGAM1252 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1252 was detected is described hereinabove with reference to Figs. 1–8.

[44679] VGAM1252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44680] VGAM1252 gene encodes a VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1252 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1252 precursor RNA is designated SEQ ID:1238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1238 is located at position 5977 relative to the genome of Human Adenovirus D.

[44681] VGAM1252 precursor RNA folds onto itself, forming VGAM1252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44682] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1252 folded precursor RNA into VGAM1252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1252 RNA is designated SEQ ID:3963, and is provided hereinbelow with reference to the sequence listing part.

[44683] VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1252 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44684] VGAM1252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1252 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44685] The complementary binding of VGAM1252 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1252 host target RNA into VGAM1252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44686] It is appreciated that VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1252 host target genes. The mRNA of each one of this plurality of VGAM1252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1252 RNA, herein designated VGAM RNA, and which when bound by VGAM1252 RNA causes inhibition of translation of respective one or more VGAM1252 host target proteins.

[44687] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1252 gene, herein designated VGAM GENE, on one or more VGAM1252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44688] It is yet further appreciated that a function of VGAM1252 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1252 correlate with, and may be deduced from, the identity of the host target genes which VGAM1252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44689] Nucleotide sequences of the VGAM1252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1252 are further described hereinbelow with reference to Table 1.

[44690] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1252 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44691] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1252 gene, herein designated VGAM is inhibition of expression of VGAM1252 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1252 correlate with, and may be deduced from, the identity of the target genes which VGAM1252 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44692] ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM_020038) is a VGAM1252 host target gene. ABCC3 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by ABCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCC3 BINDING SITE, designated SEQ ID:21293, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44693] A function of VGAM1252 is therefore inhibition of ATP-binding Cassette, Sub-family C (CFTR/MRP), Member 3 (ABCC3, Accession NM_020038), a gene which may act as an inducible transporter in the biliary and intestinal excretion of organic anions. Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCC3. The function of ABCC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM505. Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM_000391) is another VGAM1252 host target gene. CLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLN2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:5965, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44694] Another function of VGAM1252 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM_000391). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221) is another VGAM1252 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:7980, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44695] Another function of VGAM1252 is therefore inhibition of

Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221), a gene which is a type B inositol 1,4,5-trisphosphate 3 kinase. Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The function of ITPKB has been established by previous studies. Takazawa et al. (1991) isolated a second inositol 1,4,5-trisphosphate 3-kinase cDNA from a human hippocampus cDNA library. Sequencing yielded an open reading frame encoding a 472-amino acid protein with a calculated relative mass of 53,451. The C-terminal part of this enzyme, referred to as 3-kinase-B, namely, residues 187-462, was 68% identical to 3-kinase-A (OMIM Ref. No. 147521) in amino acid sequence. By in situ hybridization, Erneux et al. (1992) mapped the ITPKB gene to 1q41-q43.

[44696] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44697] Erneux, C.; Roeckel, N.; Takazawa, K.; Mailleux, P.; Vassart, G.; Mattei, M. G. : Localization of the genes for human inositol 1,4,5-trisphosphate 3-kinase A (ITPKA) and B (ITPKB) to chromosome regions 15q14-q21 and 1q41-q43, respectively, by in situ hybridization. Ge-

nomics 14: 546–547, 1992. ; and

[44698] Takazawa, K.; Perret, J.; Dumont, J. E.; Erneux, C. : Molecular cloning and expression of a new putative inositol 1,4,5–trisphosphate 3–kinase isoenzyme. Biochem. J. 278: 883–886, 1991.

[44699] Further studies establishing the function and utilities of ITPKB are found in John Hopkins OMIM database record ID 147522, and in cited publications numbered 127–128 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP586P0123 (Accession XM_170681) is another VGAM1252 host target gene. DKFZP586P0123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:45463, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44700] Another function of VGAM1252 is therefore inhibition of DKFZP586P0123 (Accession XM_170681). Accordingly, utilities of VGAM1252 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP586P0123. Dihydrolipoamide S-acetyltransferase (E2 component of pyruvate dehydrogenase complex) (DLAT, Accession XM_041355) is another VGAM1252 host target gene. DLAT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLAT BINDING SITE, designated SEQ ID:33503, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44701] Another function of VGAM1252 is therefore inhibition of Dihydrolipoamide S-acetyltransferase (E2 component of pyruvate dehydrogenase complex) (DLAT, Accession XM_041355). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLAT. FLJ10350 (Accession XM_170946) is another VGAM1252 host target gene. FLJ10350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10350, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10350 BINDING SITE, designated SEQ ID:45728, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44702] Another function of VGAM1252 is therefore inhibition of FLJ10350 (Accession XM_170946). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10350. FLJ20337 (Accession NM_017772) is another VGAM1252 host target gene. FLJ20337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20337 BINDING SITE, designated SEQ ID:19391, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44703] Another function of VGAM1252 is therefore inhibition of FLJ20337 (Accession NM_017772). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20337. Histamine Receptor H3 (HRH3, Accession NM_007232) is another VGAM1252 host target gene. HRH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH3 BINDING SITE, designated SEQ ID:14108, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44704] Another function of VGAM1252 is therefore inhibition of Histamine Receptor H3 (HRH3, Accession NM_007232). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH3. KIAA0284 (Accession XM_032235) is another VGAM1252 host target gene. KIAA0284 BINDING SITE1 and KIAA0284 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0284, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0284

BINDING SITE1 and KIAA0284 BINDING SITE2, designated SEQ ID:31617 and SEQ ID:31616 respectively, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44705] Another function of VGAM1252 is therefore inhibition of KIAA0284 (Accession XM_032235). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0284. PP1057 (Accession NM_031285) is another VGAM1252 host target gene. PP1057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1057 BINDING SITE, designated SEQ ID:25310, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44706] Another function of VGAM1252 is therefore inhibition of PP1057 (Accession NM_031285). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1057. Solute Carrier Family 12, (potassium-chloride

transporter) Member 5 (SLC12A5, Accession NM_020708) is another VGAM1252 host target gene. SLC12A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A5 BINDING SITE, designated SEQ ID:21853, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44707] Another function of VGAM1252 is therefore inhibition of Solute Carrier Family 12, (potassium-chloride transporter) Member 5 (SLC12A5, Accession NM_020708). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A5. LOC164584 (Accession XM_092883) is another VGAM1252 host target gene. LOC164584 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC164584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164584 BINDING SITE, designated SEQ ID:40157, to

the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44708] Another function of VGAM1252 is therefore inhibition of LOC164584 (Accession XM_092883). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164584. LOC253216 (Accession XM_170765) is another VGAM1252 host target gene. LOC253216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253216 BINDING SITE, designated SEQ ID:45517, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44709] Another function of VGAM1252 is therefore inhibition of LOC253216 (Accession XM_170765). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253216. LOC90120 (Accession XM_029168) is another VGAM1252 host target gene. LOC90120 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC90120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90120 BINDING SITE, designated SEQ ID:30850, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44710] Another function of VGAM1252 is therefore inhibition of LOC90120 (Accession XM_029168). Accordingly, utilities of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90120. LOC90288 (Accession XM_030669) is another VGAM1252 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31104, to the nucleotide sequence of VGAM1252 RNA, herein designated VGAM RNA, also designated SEQ ID:3963.

[44711] Another function of VGAM1252 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities

of VGAM1252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1253 (VGAM1253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44712] VGAM1253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1253 was detected is described hereinabove with reference to Figs. 1–8.

[44713] VGAM1253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44714] VGAM1253 gene encodes a VGAM1253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1253 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1253 precursor RNA is designated SEQ ID:1239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1239 is located at position 8179 relative to the genome of Human Adenovirus D.

- [44715] VGAM1253 precursor RNA folds onto itself, forming VGAM1253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44716] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1253 folded precursor RNA into VGAM1253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1253 RNA is designated SEQ ID:3964, and

is provided hereinbelow with reference to the sequence listing part.

[44717] VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1253 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[44718] VGAM1253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1253 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44719] The complementary binding of VGAM1253 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1253 host target RNA into VGAM1253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44720] It is appreciated that VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1253 host target genes. The mRNA of each one of this plurality of VGAM1253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1253 RNA, herein designated VGAM RNA, and which when bound by VGAM1253 RNA causes inhibition of translation of respective one or more VGAM1253 host target proteins.

[44721] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1253 gene, herein designated VGAM GENE, on one or more VGAM1253 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44722] It is yet further appreciated that a function of VGAM1253 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1253 correlate with, and may be deduced from, the identity of the host target genes which VGAM1253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44723] Nucleotide sequences of the VGAM1253 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1253 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1253 are further described hereinbelow with reference to Table 1.

[44724] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1253 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1253 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44725] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1253 gene, herein designated VGAM is inhibition of expression of VGAM1253 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1253 correlate with, and may be deduced from, the identity of the target genes which VGAM1253 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44726] Fibrillin 2 (congenital contractural arachnodactyly) (FBN2, Accession NM_001999) is a VGAM1253 host target gene. FBN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBN2 BINDING SITE, designated SEQ ID:7726, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44727] A function of VGAM1253 is therefore inhibition of Fibrillin 2 (congenital contractural arachnodactyly) (FBN2, Accession NM_001999), a gene which structural component of connective tissue microfibrils that binds calcium. fibrillin-2-containing microfibrils regulate the early process of elastic fiber assembly. Accordingly, utilities of VGAM1253

include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBN2. The function of FBN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM254. Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527) is another VGAM1253 host target gene. LDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDLR BINDING SITE, designated SEQ ID:6127, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44728] Another function of VGAM1253 is therefore inhibition of Low Density Lipoprotein Receptor (familial hypercholesterolemia) (LDLR, Accession NM_000527), a gene which also acts as a tumor suppressor. Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDLR. The function of LDLR and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1030.START Domain Containing 5 (STARD5, Accession NM_030574) is another VGAM1253 host target gene. STARD5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by STARD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD5 BINDING SITE, designated SEQ ID:24948, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44729] Another function of VGAM1253 is therefore inhibition of START Domain Containing 5 (STARD5, Accession NM_030574). Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD5. FLJ20308 (Accession XM_039852) is another VGAM1253 host target gene. FLJ20308 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20308 BINDING SITE, designated SEQ ID:33197, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44730] Another function of VGAM1253 is therefore inhibition of FLJ20308 (Accession XM_039852). Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20308. PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222) is another VGAM1253 host target gene. PSIP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSIP2 BINDING SITE, designated SEQ ID:27068, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44731] Another function of VGAM1253 is therefore inhibition of PC4 and SFRS1 Interacting Protein 2 (PSIP2, Accession NM_033222). Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with PSIP2. LOC163682 (Accession XM_099402) is another VGAM1253 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42091, to the nucleotide sequence of VGAM1253 RNA, herein designated VGAM RNA, also designated SEQ ID:3964.

[44732] Another function of VGAM1253 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM1253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1254 (VGAM1254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44733] VGAM1254 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1254 was detected is described hereinabove with reference to Figs. 1–8.

[44734] VGAM1254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44735] VGAM1254 gene encodes a VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1254 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1254 precursor RNA is designated SEQ ID:1240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1240 is located at position 8988 relative to the genome of Human Adenovirus D.

[44736] VGAM1254 precursor RNA folds onto itself, forming VGAM1254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44737] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1254 folded precursor RNA into VGAM1254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1254 RNA is designated SEQ ID:3965, and is provided hereinbelow with reference to the sequence listing part.

[44738] VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1254 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44739] VGAM1254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1254 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1254 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44740] The complementary binding of VGAM1254 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1254 host target RNA into VGAM1254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44741] It is appreciated that VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1254 host target genes. The mRNA of each one of this plurality of VGAM1254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1254 RNA, herein designated VGAM RNA, and which when bound by VGAM1254 RNA causes inhibition of translation of respective one or more VGAM1254 host target proteins.

[44742] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1254 gene, herein designated VGAM GENE, on one or more VGAM1254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44743] It is yet further appreciated that a function of VGAM1254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1254 correlate with, and may be deduced from, the identity of the host target genes which VGAM1254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44744] Nucleotide sequences of the VGAM1254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1254 are further described hereinbelow with reference to Table 1.

[44745] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1254 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44746] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1254 gene, herein designated VGAM is inhibition of expression of VGAM1254 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1254 correlate with, and may be deduced from, the identity of the target genes which VGAM1254 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44747] EH-domain Containing 2 (EHD2, Accession NM_014601) is a VGAM1254 host target gene. EHD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated

region of mRNA encoded by EHD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHD2 BINDING SITE, designated SEQ ID:15964, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44748] A function of VGAM1254 is therefore inhibition of EHD domain Containing 2 (EHD2, Accession NM_014601). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHD2. Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415) is another VGAM1254 host target gene. EIF2S3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2S3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2S3 BINDING SITE, designated SEQ ID:7114, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44749] Another function of VGAM1254 is therefore inhibition of

Eukaryotic Translation Initiation Factor 2, Subunit 3 Gamma, 52kDa (EIF2S3, Accession NM_001415), a gene which functions in the early steps of protein synthesis. Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2S3. The function of EIF2S3 has been established by previous studies. Translation initiation factor eIF-2 is a heterotrimeric GTP-binding protein involved in the recruitment of methionyl-tRNA(i) to the 40 S ribosomal subunit. Gasper et al. (1994) cloned a human cDNA encoding the largest subunit of eIF-2, EIF2G. The EIF2G cDNA encodes a 472-amino acid protein with a molecular mass of 51.8 kD and contains 3 consensus GTP-binding elements. Human EIF2G is highly related to the yeast homolog, GCD11, exhibiting 71% sequence identity and an additional 13% similarity. Genes controlling the functions of spermatogenesis, Spy, and expression of the male-specific minor transplantation antigen H-Y, Hya (OMIM Ref. No. 426000), map to a region of the short arm of the mouse Y chromosome, delta-Sxr(b), that lies between the zinc finger genes Zfy1 and Zfy2 (OMIM Ref. No. 490000) and is deleted in Sxr(b) mutant mice. These Sxr(b) mice arose from an original sex-reversed

mutation, Sxr(a), that carries a duplication of most of the Y chromosome short arm translocated to the telomeric end of the pseudoautosomal region of the Y chromosome. Several genes were mapped to that interval of the mouse Y chromosome and each was found to have a homolog on the X chromosome. Four of them, Zfy1 and Zfy2 (OMIM Ref. No. 490000), Ube1y (OMIM Ref. No. 489000), and Df-fry (OMIM Ref. No. 400005), are expressed specifically in the testis and their X homologs (Zfx, 314980; Ube1x, 314370; Dffrx, 300072) are not transcribed from the inactive X chromosome. A further 2, Smyc (OMIM Ref. No. 426000) and Uty (OMIM Ref. No. 400009), are ubiquitously expressed and their X homologs (Smcx, 314690; Utx, 300128) escape X inactivation. Ehrmann et al. (1998) identified another gene from this region of the mouse Y chromosome. It was found to encode the highly conserved eukaryotic translation initiation factor eIF-2-gamma. In the mouse this gene was found to be ubiquitously expressed, to have an X chromosome homolog that maps close to Dmd (OMIM Ref. No. 300377), and to escape X inactivation. The coding regions of the X and Y genes show 86% nucleotide identity and encode the putative products with 98% amino acid identity. Ehrmann et al.

(1998) found that the human homolog is located on Xp21 and also escapes X inactivation. No evidence of a Y copy of this gene was found in humans, however. In both humans and mice, Ehrmann et al. (1998) identified autosomal retroposons of EIF2G in both humans and mice and an additional retroposon on the X chromosome in some mouse strains. Ark blot analysis of eutherian and metatherian genomic DNA indicated that X-Y homologs are present in all species tested except in simian primates and kangaroo and that retroposons are common to a wide range of mammals. ('Zoo blots' are Southern blots of genomic DNA from multiple species without regard to gender; 'ark blots' are Southern blots used to compare male and female from multiple species.)

[44750] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44751] Ehrmann, I. E.; Ellis, P. S.; Mazeyrat, S.; Duthie, S.; Brockdorff, N.; Mattei, M. G.; Gavin, M. A.; Affara, N. A.; Brown, G. M.; Simpson, E.; Mitchell, M. J.; Scott, D. M. : Characterization of genes encoding translation initiation factor eIF-2-gamma in mouse and human: sex chromosome localization, escape from X-inactivation and evolution. Hum.

Molec. Genet. 7: 1725–1737, 1998. ; and

[44752] Gasper, N. J.; Kinzy, T. G.; Scherer, B. J.; Humbelin, M.; Hershey, J. W. B.; Merrick, W. C. : Translation initiation factor eIF-2: cloning and expression of the human cDNA encoding the.

[44753] Further studies establishing the function and utilities of EIF2S3 are found in John Hopkins OMIM database record ID 300161, and in cited publications numbered 11002 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028) is another VGAM1254 host target gene. FNTB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FNTB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNTB BINDING SITE, designated SEQ ID:7783, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44754] Another function of VGAM1254 is therefore inhibition of Farnesyltransferase, CAAX Box, Beta (FNTB, Accession NM_002028), a gene which transfers farnesyl groups to

proteins. Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FNTB. The function of FNTB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM615. Suppression of Tumorigenicity 7 (ST7, Accession NM_021908) is another VGAM1254 host target gene. ST7 BINDING SITE1 and ST7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7 BINDING SITE1 and ST7 BINDING SITE2, designated SEQ ID:22430 and SEQ ID:20454 respectively, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44755] Another function of VGAM1254 is therefore inhibition of Suppression of Tumorigenicity 7 (ST7, Accession NM_021908), a gene which has a role in regulating cell-environment or cell-cell interactions. Accordingly, utilities of VGAM1254 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with ST7. The function of ST7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107.FLJ14351 (Accession NM_024732) is another VGAM1254 host target gene. FLJ14351 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14351 BINDING SITE, designated SEQ ID:24072, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44756] Another function of VGAM1254 is therefore inhibition of FLJ14351 (Accession NM_024732). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14351. FLJ20154 (Accession XM_053688) is another VGAM1254 host target gene. FLJ20154 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20154 BINDING SITE, designated SEQ ID:36109, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44757] Another function of VGAM1254 is therefore inhibition of FLJ20154 (Accession XM_053688). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20154. FLJ22160 (Accession NM_024585) is another VGAM1254 host target gene. FLJ22160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22160 BINDING SITE, designated SEQ ID:23820, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44758] Another function of VGAM1254 is therefore inhibition of FLJ22160 (Accession NM_024585). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22160. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485) is another VGAM1254 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10810, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44759] Another function of VGAM1254 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM_004485). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. H2AV (Accession NM_138635) is another VGAM1254 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ

ID:28911, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44760] Another function of VGAM1254 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. KIAA1465 (Accession XM_027396) is another VGAM1254 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30504, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44761] Another function of VGAM1254 is therefore inhibition of KIAA1465 (Accession XM_027396). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 1 (SLC11A1, Acces-

sion XM_002585) is another VGAM1254 host target gene. SLC11A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A1 BINDING SITE, designated SEQ ID:29902, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44762] Another function of VGAM1254 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 1 (SLC11A1, Accession XM_002585). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A1. Transducin-like Enhancer of Split 4 (E(sp1) Homolog, Drosophila) (TLE4, Accession XM_042357) is another VGAM1254 host target gene. TLE4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TLE4 BINDING SITE, designated SEQ ID:33720, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44763] Another function of VGAM1254 is therefore inhibition of Transducin-like Enhancer of Split 4 (E(sp1) Homolog, *Drosophila*) (TLE4, Accession XM_042357). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLE4. LOC126353 (Accession XM_059034) is another VGAM1254 host target gene. LOC126353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126353 BINDING SITE, designated SEQ ID:36832, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44764] Another function of VGAM1254 is therefore inhibition of LOC126353 (Accession XM_059034). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126353. LOC145725 (Accession XM_085211) is an-

other VGAM1254 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37951, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44765] Another function of VGAM1254 is therefore inhibition of LOC145725 (Accession XM_085211). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM_085218) is another VGAM1254 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37960, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44766] Another function of VGAM1254 is therefore inhibition of LOC145732 (Accession XM_085218). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC146443 (Accession XM_085461) is another VGAM1254 host target gene. LOC146443 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146443 BINDING SITE, designated SEQ ID:38149, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44767] Another function of VGAM1254 is therefore inhibition of LOC146443 (Accession XM_085461). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146443. LOC166983 (Accession XM_106422) is another VGAM1254 host target gene. LOC166983 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166983, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166983 BINDING SITE, designated SEQ ID:42199, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44768] Another function of VGAM1254 is therefore inhibition of LOC166983 (Accession XM_106422). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166983. LOC196957 (Accession XM_113789) is another VGAM1254 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42432, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44769] Another function of VGAM1254 is therefore inhibition of LOC196957 (Accession XM_113789). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196957. LOC196961 (Accession XM_113790) is another VGAM1254 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42441, to the nucleotide sequence of VGAM1254 RNA, herein designated VGAM RNA, also designated SEQ ID:3965.

[44770] Another function of VGAM1254 is therefore inhibition of LOC196961 (Accession XM_113790). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM_113829) is another VGAM1254 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42459, to the nucleotide sequence of VGAM1254 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3965.

[44771] Another function of VGAM1254 is therefore inhibition of LOC197138 (Accession XM_113829). Accordingly, utilities of VGAM1254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1255 (VGAM1255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44772] VGAM1255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1255 was detected is described hereinabove with reference to Figs. 1–8.

[44773] VGAM1255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44774] VGAM1255 gene encodes a VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1255 precursor RNA is designated SEQ ID:1241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1241 is located at position 5672 relative to the genome of Human Adenovirus D.

- [44775] VGAM1255 precursor RNA folds onto itself, forming VGAM1255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [44776] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1255 folded precursor RNA into VGAM1255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1255 RNA is designated SEQ ID:3966, and is provided hereinbelow with reference to the sequence listing part.

[44777] VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1255 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44778] VGAM1255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1255 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[44779] The complementary binding of VGAM1255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1255 host target RNA into VGAM1255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44780] It is appreciated that VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1255 host target genes. The mRNA of

each one of this plurality of VGAM1255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1255 RNA, herein designated VGAM RNA, and which when bound by VGAM1255 RNA causes inhibition of translation of respective one or more VGAM1255 host target proteins.

[44781] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1255 gene, herein designated VGAM GENE, on one or more VGAM1255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[44782] It is yet further appreciated that a function of VGAM1255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1255 correlate with, and may be deduced from, the identity of the host target genes which VGAM1255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44783] Nucleotide sequences of the VGAM1255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1255 are further described hereinbelow with reference to Table 1.

[44784] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1255 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1255 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44785] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1255 gene, herein designated VGAM is inhibition of expression of VGAM1255 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1255 correlate with, and may be deduced from, the identity of the target genes which VGAM1255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44786] Contactin 2 (axonal) (CNTN2, Accession NM_005076) is a VGAM1255 host target gene. CNTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN2 BINDING SITE, designated SEQ ID:11525, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44787] A function of VGAM1255 is therefore inhibition of Contactin 2 (axonal) (CNTN2, Accession NM_005076), a gene which may play a role in axonal growth and cell adhesion.

Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN2. The function of CNTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259. FKRP (Accession NM_024301) is another VGAM1255 host target gene. FKRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKRP BINDING SITE, designated SEQ ID:23593, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44788] Another function of VGAM1255 is therefore inhibition of FKRP (Accession NM_024301). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKRP. Hairless Homolog (mouse) (HR, Accession NM_005144) is another VGAM1255 host target gene. HR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HR, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HR BINDING SITE, designated SEQ ID:11618, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44789] Another function of VGAM1255 is therefore inhibition of Hairless Homolog (mouse) (HR, Accession NM_005144). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HR. Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM_012405) is another VGAM1255 host target gene. ICMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICMT BINDING SITE, designated SEQ ID:14781, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44790] Another function of VGAM1255 is therefore inhibition of Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Ac-

cession NM_012405). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICMT. Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM1255 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8276, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44791] Another function of VGAM1255 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020975) is another VGAM1255 host target gene. RET BINDING SITE1 and RET BINDING SITE2 are HOST TARGET binding sites found in untranslated re-

gions of mRNA encoded by RET, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE1 and RET BINDING SITE2, designated SEQ ID:21960 and SEQ ID:21786 respectively, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44792] Another function of VGAM1255 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020975), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381. Ubiquitin-conjugating Enzyme E2H (UBC8 homolog, yeast) (UBE2H, Accession NM_003344) is another VGAM1255 host target gene. UBE2H BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2H, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2H BINDING SITE, designated SEQ ID:9352, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44793] Another function of VGAM1255 is therefore inhibition of Ubiquitin-conjugating Enzyme E2H (UBC8 homolog, yeast) (UBE2H, Accession NM_003344), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2H. The function of UBE2H and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM811.Centaurin, Gamma 1 (CENTG1, Accession NM_014770) is another VGAM1255 host target gene. CENTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CENTG1 BINDING SITE, designated SEQ ID:16563, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44794] Another function of VGAM1255 is therefore inhibition of Centaurin, Gamma 1 (CENTG1, Accession NM_014770). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG1. FLJ10901 (Accession NM_018265) is another VGAM1255 host target gene. FLJ10901 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10901 BINDING SITE, designated SEQ ID:20232, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44795] Another function of VGAM1255 is therefore inhibition of FLJ10901 (Accession NM_018265). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10901. Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM_032664) is another VGAM1255 host target gene. FUT10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT10 BINDING SITE, designated SEQ ID:26391, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44796] Another function of VGAM1255 is therefore inhibition of Fucosyltransferase 10 (alpha (1,3) Fucosyltransferase) (FUT10, Accession NM_032664). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT10. Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903) is another VGAM1255 host target gene. GABBR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GABBR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GABBR1 BINDING SITE, designated SEQ ID:22424, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44797] Another function of VGAM1255 is therefore inhibition of Gamma-aminobutyric Acid (GABA) B Receptor, 1 (GABBR1, Accession NM_021903). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GABBR1. KIAA1399 (Accession XM_046685) is another VGAM1255 host target gene. KIAA1399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:34798, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44798] Another function of VGAM1255 is therefore inhibition of KIAA1399 (Accession XM_046685). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1399. KIAA1924 (Accession XM_057091) is another VGAM1255 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36481, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44799] Another function of VGAM1255 is therefore inhibition of KIAA1924 (Accession XM_057091). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335) is another VGAM1255 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30689, to the nucleotide sequence of

VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44800] Another function of VGAM1255 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM_028335). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRPF8. LOC221935 (Accession XM_166537) is another VGAM1255 host target gene. LOC221935 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221935, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221935 BINDING SITE, designated SEQ ID:44501, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44801] Another function of VGAM1255 is therefore inhibition of LOC221935 (Accession XM_166537). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221935. LOC245771 (Accession XM_167366) is another VGAM1255 host target gene. LOC245771 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245771 BINDING SITE, designated SEQ ID:44637, to the nucleotide sequence of VGAM1255 RNA, herein designated VGAM RNA, also designated SEQ ID:3966.

[44802] Another function of VGAM1255 is therefore inhibition of LOC245771 (Accession XM_167366). Accordingly, utilities of VGAM1255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245771. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1256 (VGAM1256) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44803] VGAM1256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1256 was detected is described hereinabove with reference to Figs. 1-8.

[44804] VGAM1256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44805] VGAM1256 gene encodes a VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1256 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1256 precursor RNA is designated SEQ ID:1242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1242 is located at position 4027 relative to the genome of Human Adenovirus D.

[44806] VGAM1256 precursor RNA folds onto itself, forming VGAM1256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[44807] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1256 folded precursor RNA into VGAM1256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1256 RNA is designated SEQ ID:3967, and is provided hereinbelow with reference to the sequence listing part.

[44808] VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1256 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44809] VGAM1256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1256 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1256 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44810] The complementary binding of VGAM1256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1256 host target RNA into VGAM1256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44811] It is appreciated that VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1256 host target genes. The mRNA of each one of this plurality of VGAM1256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1256 RNA, herein designated VGAM RNA, and which when bound by VGAM1256 RNA causes inhibition of translation of respective one or more VGAM1256 host target proteins.

[44812] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1256 gene, herein designated VGAM GENE, on one or more VGAM1256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44813] It is yet further appreciated that a function of VGAM1256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1256 correlate with, and may be deduced from, the identity of the host target genes which VGAM1256 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44814] Nucleotide sequences of the VGAM1256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1256 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1256 are further described hereinbelow with reference to Table 1.

[44815] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1256 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44816] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1256 gene, herein designated VGAM is inhibition of expression of VGAM1256 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1256 correlate with, and may be deduced from, the identity of the target genes which VGAM1256 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44817] Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_022977) is a VGAM1256 host target gene. FACL4 BINDING SITE1 and FACL4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FACL4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE1 and FACL4 BINDING SITE2, designated SEQ ID:23251 and SEQ ID:10761 respectively, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44818] A function of VGAM1256 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_022977). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4. Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885) is another VGAM1256 host target gene. ITGA4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ITGA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA4 BINDING SITE, designated SEQ ID:6583, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44819] Another function of VGAM1256 is therefore inhibition of

Integrin, Alpha 4 (antigen CD49D, alpha 4 subunit of VLA-4 receptor) (ITGA4, Accession NM_000885), a gene which recognizes one or more domains within the alternatively spliced cs-1 and cs-5 regions of fibronectin. Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA4. The function of ITGA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1096. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326) is another VGAM1256 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14714, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44820] Another function of VGAM1256 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326), a gene which interact

with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of MAPRE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. MHC Class II Transactivator (MHC2TA, Accession NM_000246) is another VGAM1256 host target gene. MHC2TA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MHC2TA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MHC2TA BINDING SITE, designated SEQ ID:5779, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44821] Another function of VGAM1256 is therefore inhibition of MHC Class II Transactivator (MHC2TA, Accession NM_000246). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MHC2TA. Matrix Metallo-

proteinase 15 (membrane-inserted) (MMP15, Accession NM_002428) is another VGAM1256 host target gene. MMP15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP15 BINDING SITE, designated SEQ ID:8263, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44822] Another function of VGAM1256 is therefore inhibition of Matrix Metalloproteinase 15 (membrane-inserted) (MMP15, Accession NM_002428). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP15. AD-020 (Accession NM_020141) is another VGAM1256 host target gene. AD-020 BINDING SITE1 and AD-020 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AD-020, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of AD-020 BINDING SITE1 and AD-020 BINDING SITE2, designated SEQ ID:21339 and SEQ ID:29869 respectively, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44823] Another function of VGAM1256 is therefore inhibition of AD-020 (Accession NM_020141). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020. KIAA1808 (Accession XM_098260) is another VGAM1256 host target gene. KIAA1808 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1808, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1808 BINDING SITE, designated SEQ ID:41547, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44824] Another function of VGAM1256 is therefore inhibition of KIAA1808 (Accession XM_098260). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1808. KIAA1867 (Accession XM_170675) is another VGAM1256 host target gene. KIAA1867 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1867 BINDING SITE, designated SEQ ID:45454, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44825] Another function of VGAM1256 is therefore inhibition of KIAA1867 (Accession XM_170675). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1867. KIAA1904 (Accession XM_056282) is another VGAM1256 host target gene. KIAA1904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1904 BINDING SITE, designated SEQ ID:36382, to the nucleotide sequence of VGAM1256 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3967.

[44826] Another function of VGAM1256 is therefore inhibition of KIAA1904 (Accession XM_056282). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1904. MGC4796 (Accession XM_029031) is another VGAM1256 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30828, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44827] Another function of VGAM1256 is therefore inhibition of MGC4796 (Accession XM_029031). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4796. T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM_012454) is another VGAM1256 host target gene. TIAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by TIAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAM2 BINDING SITE, designated SEQ ID:14823, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44828] Another function of VGAM1256 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM_012454). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAM2. TSPEAR (Accession NM_144991) is another VGAM1256 host target gene. TSPEAR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSPEAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPEAR BINDING SITE, designated SEQ ID:29597, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44829] Another function of VGAM1256 is therefore inhibition of

TSPEAR (Accession NM_144991). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPEAR. LOC158310 (Accession XM_098919) is another VGAM1256 host target gene. LOC158310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158310 BINDING SITE, designated SEQ ID:41943, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44830] Another function of VGAM1256 is therefore inhibition of LOC158310 (Accession XM_098919). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158310. LOC199990 (Accession XM_114083) is another VGAM1256 host target gene. LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42683, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44831] Another function of VGAM1256 is therefore inhibition of LOC199990 (Accession XM_114083). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. LOC220143 (Accession XM_168046) is another VGAM1256 host target gene. LOC220143 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220143 BINDING SITE, designated SEQ ID:44954, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44832] Another function of VGAM1256 is therefore inhibition of LOC220143 (Accession XM_168046). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220143. LOC90249 (Accession XM_030300) is an-

other VGAM1256 host target gene. LOC90249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90249 BINDING SITE, designated SEQ ID:31011, to the nucleotide sequence of VGAM1256 RNA, herein designated VGAM RNA, also designated SEQ ID:3967.

[44833] Another function of VGAM1256 is therefore inhibition of LOC90249 (Accession XM_030300). Accordingly, utilities of VGAM1256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1257 (VGAM1257) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44834] VGAM1257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1257 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[44835] VGAM1257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44836] VGAM1257 gene encodes a VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1257 precursor RNA is designated SEQ ID:1243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1243 is located at position 39908 relative to the genome of Yaba-like Disease Virus.

[44837] VGAM1257 precursor RNA folds onto itself, forming VGAM1257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44838] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1257 folded precursor RNA into VGAM1257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1257 RNA is designated SEQ ID:3968, and is provided hereinbelow with reference to the sequence listing part.

[44839] VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1257 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44840] VGAM1257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1257 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44841] The complementary binding of VGAM1257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1257 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1257 host target RNA into VGAM1257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44842] It is appreciated that VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1257 host target genes. The mRNA of each one of this plurality of VGAM1257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1257 RNA, herein designated VGAM RNA, and which when bound by VGAM1257 RNA causes inhibition of translation of respective one or more VGAM1257 host target proteins.

[44843] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1257 gene, herein designated VGAM GENE, on one or more VGAM1257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44844] It is yet further appreciated that a function of VGAM1257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1257 correlate with, and may be deduced from, the identity of the host target genes which VGAM1257 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44845] Nucleotide sequences of the VGAM1257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1257 are further described hereinbelow with reference to Table 1.

[44846] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1257 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44847] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1257 gene, herein designated VGAM is inhibition of expression of VGAM1257 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1257 correlate with, and may be deduced from, the identity of the target genes which VGAM1257 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44848] ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164) is a VGAM1257 host target gene. ABCD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCD2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD2 BINDING SITE, designated SEQ ID:11656, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44849] A function of VGAM1257 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 2 (ABCD2, Accession NM_005164), a gene which probable transporter. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD2. The function of ABCD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229.ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702) is another VGAM1257 host target gene. ATP1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1A2 BINDING SITE, designated SEQ

ID:6369, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44850] Another function of VGAM1257 is therefore inhibition of ATPase, Na⁺/K⁺ Transporting, Alpha 2 (+) Polypeptide (ATP1A2, Accession NM_000702). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1A2. Endothelin Receptor Type A (EDNRA, Accession XM_034331) is another VGAM1257 host target gene. EDNRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDNRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRA BINDING SITE, designated SEQ ID:32061, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44851] Another function of VGAM1257 is therefore inhibition of Endothelin Receptor Type A (EDNRA, Accession XM_034331), a gene which binds endothelins, and induces intracellular calcium flux and arachidonic acid ac-

cumulation. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDNRA. The function of EDNRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM441. Myeloid Cell Leukemia Sequence 1

(BCL2-related) (MCL1, Accession NM_021960) is another VGAM1257 host target gene. MCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCL1 BINDING SITE, designated SEQ ID:22488, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44852] Another function of VGAM1257 is therefore inhibition of Myeloid Cell Leukemia Sequence 1 (BCL2-related) (MCL1, Accession NM_021960), a gene which involved in programming of differentiation and concomitant maintenance of viability. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCL1. The function of MCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1083. Transcription Elongation Factor A (SII), 1 (TCEA1, Accession XM_087370) is another VGAM1257 host target gene. TCEA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCEA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCEA1 BINDING SITE, designated SEQ ID:39204, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44853] Another function of VGAM1257 is therefore inhibition of Transcription Elongation Factor A (SII), 1 (TCEA1, Acces-

sion XM_087370), a gene which helps RNA polymerase II to transcribe past blockages. Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCEA1. The function of TCEA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM211.MGC2376 (Accession NM_023930) is another VGAM1257 host target gene. MGC2376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2376 BINDING SITE, designated SEQ ID:23413, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44854] Another function of VGAM1257 is therefore inhibition of MGC2376 (Accession NM_023930). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2376. MIG2 (Accession XM_051693) is another VGAM1257 host target gene. MIG2 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by MIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG2 BINDING SITE, designated SEQ ID:35862, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44855] Another function of VGAM1257 is therefore inhibition of MIG2 (Accession XM_051693). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIG2. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM1257 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16179, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44856] Another function of VGAM1257 is therefore inhibition of

Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC151473 (Accession XM_087215) is another VGAM1257 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39123, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44857] Another function of VGAM1257 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC151521 (Accession XM_098076) is another VGAM1257 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:41365, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44858] Another function of VGAM1257 is therefore inhibition of LOC151521 (Accession XM_098076). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC197131 (Accession XM_113823) is another VGAM1257 host target gene. LOC197131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197131 BINDING SITE, designated SEQ ID:42448, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44859] Another function of VGAM1257 is therefore inhibition of LOC197131 (Accession XM_113823). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC197131. LOC254973 (Accession XM_172751) is another VGAM1257 host target gene. LOC254973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254973 BINDING SITE, designated SEQ ID:46078, to the nucleotide sequence of VGAM1257 RNA, herein designated VGAM RNA, also designated SEQ ID:3968.

[44860] Another function of VGAM1257 is therefore inhibition of LOC254973 (Accession XM_172751). Accordingly, utilities of VGAM1257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1258 (VGAM1258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44861] VGAM1258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1258 was detected is described hereinabove with reference to Figs. 1–8.

[44862] VGAM1258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44863] VGAM1258 gene encodes a VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1258 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1258 precursor RNA is designated SEQ ID:1244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1244 is located at position 40891 relative to the genome of Yaba-like Disease Virus.

[44864] VGAM1258 precursor RNA folds onto itself, forming VGAM1258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44865] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1258 folded precursor RNA into VGAM1258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1258 RNA is designated SEQ ID:3969, and is provided hereinbelow with reference to the sequence listing part.

[44866] VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1258 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44867] VGAM1258 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1258 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[44868] The complementary binding of VGAM1258 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1258 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1258 host target RNA into VGAM1258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44869] It is appreciated that VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1258 host target genes. The mRNA of each one of this plurality of VGAM1258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1258 RNA, herein designated VGAM RNA, and which when bound by VGAM1258 RNA causes inhibition of translation of respective one or more VGAM1258 host target proteins.

[44870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1258 gene, herein designated VGAM GENE, on one or more VGAM1258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44871] It is yet further appreciated that a function of VGAM1258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1258 correlate with, and may be deduced from, the identity of the host target genes which VGAM1258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44872] Nucleotide sequences of the VGAM1258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1258 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1258 are further described hereinbelow with reference to Table 1.

[44873] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1258 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44874] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1258 gene, herein designated VGAM is inhibition of expression of VGAM1258 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1258 correlate with, and may be deduced from, the identity of the target genes which VGAM1258 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44875] Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is a VGAM1258 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6644, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44876] A function of VGAM1258 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497.KIAA0471 (Accession NM_014857) is another VGAM1258 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16914, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44877] Another function of VGAM1258 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA1594 (Accession XM_050754) is another VGAM1258 host target gene. KIAA1594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1594 BINDING SITE, designated SEQ ID:35673, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44878] Another function of VGAM1258 is therefore inhibition of KIAA1594 (Accession XM_050754). Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1594. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM1258 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21194, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44879] Another function of VGAM1258 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. LOC219401 (Accession XM_166706) is another VGAM1258 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, desig-

nated SEQ ID:44588, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44880] Another function of VGAM1258 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC219686 (Accession XM_165544) is another VGAM1258 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43677, to the nucleotide sequence of VGAM1258 RNA, herein designated VGAM RNA, also designated SEQ ID:3969.

[44881] Another function of VGAM1258 is therefore inhibition of LOC219686 (Accession XM_165544). Accordingly, utilities of VGAM1258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1259 (VGAM1259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44882] VGAM1259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1259 was detected is described hereinabove with reference to Figs. 1–8.

[44883] VGAM1259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant Reversion Virus. VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44884] VGAM1259 gene encodes a VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1259 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1259 precursor RNA is designated SEQ ID:1245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1245 is located at position 4609 relative to the

genome of Blackcurrant Reversion Virus.

[44885] VGAM1259 precursor RNA folds onto itself, forming VGAM1259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44886] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1259 folded precursor RNA into VGAM1259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1259 RNA is designated SEQ ID:3970, and is provided hereinbelow with reference to the sequence listing part.

[44887] VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1259 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[44888] VGAM1259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1259 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44889] The complementary binding of VGAM1259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1259 host target RNA into VGAM1259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44890] It is appreciated that VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1259 host target genes. The mRNA of each one of this plurality of VGAM1259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1259 RNA, herein designated VGAM RNA, and which when bound by VGAM1259 RNA causes inhibition of translation of respective one or more VGAM1259 host target proteins.

[44891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1259 gene, herein designated VGAM GENE, on one or more VGAM1259 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44892] It is yet further appreciated that a function of VGAM1259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of viral infection by Blackcurrant Reversion Virus. Specific functions, and accordingly utilities, of

VGAM1259 correlate with, and may be deduced from, the identity of the host target genes which VGAM1259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44893] Nucleotide sequences of the VGAM1259 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1259 are further described hereinbelow with reference to Table 1.

[44894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1259 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44895] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1259 gene, herein designated VGAM is inhibition of expression of VGAM1259 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1259 correlate with, and may be deduced

from, the identity of the target genes which VGAM1259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44896] ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is a VGAM1259 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44915, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44897] A function of VGAM1259 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Cleavage and Polyadenylation Specific Factor 6, 68kDa (CPSF6, Accession NM_007007) is another VGAM1259 host target gene. CPSF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by CPSF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF6 BINDING SITE, designated SEQ ID:13869, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44898] Another function of VGAM1259 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 6, 68kDa (CPSF6, Accession NM_007007). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF6. HIR Histone Cell Cycle Regulation Defective Homolog A (*S. cerevisiae*) (HIRA, Accession NM_003325) is another VGAM1259 host target gene. HIRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIRA BINDING SITE, designated SEQ ID:9325, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44899] Another function of VGAM1259 is therefore inhibition of HIR Histone Cell Cycle Regulation Defective Homolog A (*S. cerevisiae*) (HIRA, Accession NM_003325), a gene which could have a part in mechanisms of transcriptional regulation similar to that played by yeast hir1 and hir2 together. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIRA. The function of HIRA has been established by previous studies. The human TUPLE1 gene encodes a putative transcription regulator with a sequence similar to that of the yeast TUP1 gene (Halford et al., 1993). The protein product of the TUPLE1 gene contains WD40 domains, motifs thought to be involved in protein-protein interactions. Halford et al. (1993) demonstrated that the TUPLE1 gene maps to chromosome 22 and to the shortest region of deletion overlap in a series of over 100 patients with the DiGeorge syndrome (DGS; 188400), velocardiofacial syndrome (VCFS; 192430), or a related disorder. It is expressed in a range of fetal tissues. Halford et al. (1993) cloned the murine Tuple1 gene and showed that it has strong sequence similarity to the human gene. Since TUPLE1 is a candidate gene for DGS through the mechanism of haploinsufficiency and it might

be possible to produce models of this disorder by creating mutations in the mouse gene, Mattei et al. (1994) mapped the gene to mouse chromosome 16 by isotopic in situ hybridization. The experiments were carried out using metaphase spreads from a WMP male mouse in which all of the autosomes, except 19, were in the form of meta-centric Robertsonian translocations. In the human, TUPLE1 is centromeric to COMT (OMIM Ref. No. 116790), which in turn is centromeric to IGLC1 (OMIM Ref. No. 147220); all of these expressed sequences map to mouse chromosome 16. Magnaghi et al. (1998) reported an interaction between HIRA and the transcription factor PAX3 (OMIM Ref. No. 606597). PAX3 haploinsufficiency results in the mouse 'splotch' and human Waardenburg syndrome (see OMIM Ref. No. 193500) phenotypes. Mice homozygous for PAX3 mutations die in utero with a phenocopy of DiGeorge syndrome, or neonatally with neural tube defects. HIRA was also found to interact with core histones. Thus, altered stoichiometry of complexes containing HIRA may be important for the development of structures affected in Waardenburg syndrome and DiGeorge syndrome.

[44900] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [44901] Halford, S.; Wilson, D. I.; Daw, S. C. M.; Roberts, C.; Wadey, R.; Kamath, S.; Wickremasinghe, A.; Burn, J.; Goodship, J.; Mattei, M.-G.; Moorman, A. F. M.; Scambler, P. J. : Isolation of a gene expressed during early embryogenesis from the region of 22q11 commonly deleted in DiGeorge syndrome. *Hum. Molec. Genet.* 2: 1577–1582, 1993. ; and
- [44902] Magnaghi, P.; Roberts, C.; Lorain, S.; Lipinski, M.; Scambler, P. J. : HIRA, a mammalian homologue of *Saccharomyces cerevisiae* transcriptional co-repressors, interacts with Pax3. *Natur.*
- [44903] Further studies establishing the function and utilities of HIRA are found in John Hopkins OMIM database record ID 600237, and in cited publications numbered 593 and 7692–7698 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domains Containing 1 (LIMD1, Accession NM_014240) is another VGAM1259 host target gene. LIMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:15499, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44904] Another function of VGAM1259 is therefore inhibition of LIM Domains Containing 1 (LIMD1, Accession NM_014240). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1. NKX3A (Accession NM_006167) is another VGAM1259 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12829, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44905] Another function of VGAM1259 is therefore inhibition of NKX3A (Accession NM_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1259 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM481. Neuregulin 1 (NRG1, Accession NM_013959) is another VGAM1259 host target gene. NRG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRG1 BINDING SITE, designated SEQ ID:15140, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44906] Another function of VGAM1259 is therefore inhibition of Neuregulin 1 (NRG1, Accession NM_013959), a gene which is essential for neuronal development. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRG1. The function of NRG1 has been established by previous studies. The NEU/ERBB2 protooncogene (OMIM Ref. No. 164870) encodes a molecule that is closely related to epidermal growth factor receptor (EGFR; 131550)

but binds none of the ligands of this receptor. Originally, NEU was identified as a dominant transforming gene in tumors of the peripheral nervous system that were induced by transplacental treatment of rat embryos with N-ethylnitrosourea. The period of susceptibility of NEU to carcinogenesis, i.e., midgestation, correlated with the timing of its expression in the nervous system. The existence of a NEU-specific ligand of endogenous nature activating NEU at a specific developmental stage was suggested. This ligand, known as heregulin (Holmes et al., 1992) or NEU differentiation factor, is a 44-kD glycoprotein that interacts with the NEU/ERBB2 receptor tyrosine kinase to increase its phosphorylation on tyrosine residues. Splice variants of heregulin, referred to as heregulin betas, have been described by Holmes et al. (1992). Animal model experiments lend further support to the function of NRG1. Mice homozygous for disruptions of all NRG1 isoforms, all Ig-NRG1 isoforms, and all cytoplasmic tail-containing isoforms die at embryonic day 10.5 from cardiac defects. In particular, these mice die before significant expression of CRD-NRG1 isoforms, which predominate after midgestation. By histologic analyses, Wolpowitz et al. (2000) found that homozygous CRD-

NRG1-deficient mice had normal neuronal trajectory and outgrowth, but that the projections defasciculated, branched abnormally, and failed to sustain peripheral neuromuscular synaptic development. Newborn mutants had immature skeletal muscle. Schwann cells were generated in the mutants but failed to survive, consistent with the designation of NRG1 as a Schwann cell survival factor. Schwann cells in turn appeared to provide trophic support only after the nerve had entered its target field and had begun synapse formation.

[44907] It is appreciated that the abovementioned animal model for NRG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[44908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44909] Holmes, W. E.; Sliwkowski, M. X.; Akita, R. W.; Henzel, W. J.; Lee, J.; Park, J. W.; Yansura, D.; Abadi, N.; Raab, H.; Lewis, G. D.; Shepard, H. M.; Kuang, W.-J.; Wood, W. I.; Goeddel, D. V.; Vandlen, R. L. : Identification of heregulin, a specific activator of p185(erbB2). Science 256: 1205-1210, 1992. ; and

[44910] Wolpowitz, D.; Mason, T. B. A.; Dietrich, P.; Mendelsohn, M.; Talmage, D. A.; Role, L. W. : Cysteine-rich domain isoforms of the neuregulin-1 gene are required for maintenance of periph.

[44911] Further studies establishing the function and utilities of NRG1 are found in John Hopkins OMIM database record ID 142445, and in cited publications numbered 11569-11577, 188 and 11612 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Purinergic Receptor P2Y, G-protein Coupled, 2 (P2RY2, Accession NM_002564) is another VGAM1259 host target gene. P2RY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY2 BINDING SITE, designated SEQ ID:8413, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44912] Another function of VGAM1259 is therefore inhibition of Purinergic Receptor P2Y, G-protein Coupled, 2 (P2RY2, Accession NM_002564), a gene which mediates cellular

responses to ATP. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY2. The function of P2RY2 has been established by previous studies. The chloride ion secretory pathway that is defective in cystic fibrosis (OMIM Ref. No. 219700) can be bypassed by an alternative pathway for chloride ion transport that is activated by extracellular nucleotides. Accordingly, the P2 receptor that mediates this effect is a therapeutic target for improving chloride secretion in CF patients. Parr et al. (1994) reported the sequence and functional expression of a cDNA cloned from human airway epithelial cells that encodes a protein with properties of a P2U nucleotide receptor. With a retrovirus system, the human airway clone was stably expressed in 1321N1 astrocytoma cells, a human cell line unresponsive to extracellular nucleotides. Studies of inositol phosphate accumulation and intracellular Ca^{2+} mobilization induced by extracellular nucleotides in 1321N1 cells expressing the receptor identified this clone as the target receptor in human airway epithelia. Parr et al. (1994) also isolated an identical cDNA from human colonic epithelial cells, indicating that this is the same P2U receptor that had been functionally identi-

fied in other human tissues. Expression of the human P2U receptor in 1321N1 cells revealed evidence for autocrine ATP release and stimulation of transduced receptors.

Thus, P2U expression in the cell line was proposed as a useful system for studying autocrine regulatory mechanisms and for screening potential therapeutic drugs. Tai et al. (2000) studied the expression and regulation of the P2UR gene in human granulosa-luteal cells (GLCs) by RT-PCR and Northern blot analysis. Expression of P2UR mRNA was downregulated by human chorionic gonadotropin (CG) in a dose- and time-dependent manner. Treatment with 8-bromo-cAMP and forskolin also attenuated P2UR mRNA levels. The authors concluded that the P2UR mRNA is expressed in human GLCs and that P2UR mRNA is regulated by human CG, cAMP, and forskolin. These findings further supported a potential role of this neurotransmitter receptor in the human ovary.

[44913] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[44914] Parr, C. E.; Sullivan, D. M.; Paradiso, A. M.; Lazarowski, E. R.; Burch, L. H.; Olsen, J. C.; Erb, L.; Weisman, G. A.; Boucher, R. C.; Turner, J. T. : Cloning and expression of a

human P(2U) nucleotide receptor, a target for cystic fibrosis pharmacotherapy. Proc. Nat. Acad. Sci. 91: 3275–3279, 1994. ; and

[44916] Further studies establishing the function and utilities of P2RY2 are found in John Hopkins OMIM database record ID 600041, and in cited publications numbered 7715–7719 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Piccolo (presynaptic cytomatrix protein) (PCLO, Accession XM_168530) is another VGAM1259 host target gene. PCLO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCLO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCLO BINDING SITE, designated SEQ ID:45212, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44917] Another function of VGAM1259 is therefore inhibition of

Piccolo (presynaptic cytomatrix protein) (PCLO, Accession XM_168530), a gene which involves in the cycling of synaptic vesicles. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCLO. The function of PCLO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Serine (or cysteine) Proteinase Inhibitor, Clade D (heparin cofactor), Member 1 (SERPIND1, Accession NM_000185) is another VGAM1259 host target gene. SERPIND1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPIND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPIND1 BINDING SITE, designated SEQ ID:5688, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44918] Another function of VGAM1259 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade D (heparin cofactor), Member 1 (SERPIND1, Accession NM_000185). Accordingly, utilities of VGAM1259 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with SERPIND1. Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM_020182) is another VGAM1259 host target gene. TMEPAI BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TMEPAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:21403, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44919] Another function of VGAM1259 is therefore inhibition of Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM_020182). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662) is another VGAM1259 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19196, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44920] Another function of VGAM1259 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Cadherin-like 26 (CDH26, Accession NM_021810) is another VGAM1259 host target gene. CDH26 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH26 BINDING SITE, designated SEQ

ID:22369, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44921] Another function of VGAM1259 is therefore inhibition of Cadherin-like 26 (CDH26, Accession NM_021810). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH26. FLJ12587 (Accession NM_022480) is another VGAM1259 host target gene. FLJ12587 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12587 BINDING SITE, designated SEQ ID:22851, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44922] Another function of VGAM1259 is therefore inhibition of FLJ12587 (Accession NM_022480). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587. KIAA0759 (Accession XM_041090) is another VGAM1259 host target gene. KIAA0759 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0759 BINDING SITE, designated SEQ ID:33439, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44923] Another function of VGAM1259 is therefore inhibition of KIAA0759 (Accession XM_041090). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0759. MGC4294 (Accession NM_024314) is another VGAM1259 host target gene. MGC4294 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4294 BINDING SITE, designated SEQ ID:23607, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44924] Another function of VGAM1259 is therefore inhibition of

MGC4294 (Accession NM_024314). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4294. SARM (Accession NM_015077) is another VGAM1259 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17461, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44925] Another function of VGAM1259 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. LOC146481 (Accession XM_085484) is another VGAM1259 host target gene. LOC146481 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:38175, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44926] Another function of VGAM1259 is therefore inhibition of LOC146481 (Accession XM_085484). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481. LOC152002 (Accession XM_087360) is another VGAM1259 host target gene. LOC152002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152002 BINDING SITE, designated SEQ ID:39196, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44927] Another function of VGAM1259 is therefore inhibition of LOC152002 (Accession XM_087360). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152002. LOC153205 (Accession XM_098322) is an-

other VGAM1259 host target gene. LOC153205 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153205 BINDING SITE, designated SEQ ID:41579, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44928] Another function of VGAM1259 is therefore inhibition of LOC153205 (Accession XM_098322). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153205. LOC220565 (Accession XM_165417) is another VGAM1259 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:43631, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44929] Another function of VGAM1259 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC221362 (Accession XM_168093) is another VGAM1259 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45019, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44930] Another function of VGAM1259 is therefore inhibition of LOC221362 (Accession XM_168093). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. LOC92078 (Accession XM_042684) is another VGAM1259 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33745, to the nucleotide sequence of VGAM1259 RNA, herein designated VGAM RNA, also designated SEQ ID:3970.

[44931] Another function of VGAM1259 is therefore inhibition of LOC92078 (Accession XM_042684). Accordingly, utilities of VGAM1259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1260 (VGAM1260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44932] VGAM1260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1260 was detected is described hereinabove with reference to Figs. 1–8.

[44933] VGAM1260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant Reversion Virus. VGAM1260 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44934] VGAM1260 gene encodes a VGAM1260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1260 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1260 precursor RNA is designated SEQ ID:1246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1246 is located at position 1827 relative to the genome of Blackcurrant Reversion Virus.

[44935] VGAM1260 precursor RNA folds onto itself, forming VGAM1260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44936] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1260 folded precursor RNA into VGAM1260

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM1260 RNA is designated SEQ ID:3971, and is provided hereinbelow with reference to the sequence listing part.

[44937] VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1260 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44938] VGAM1260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1260 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44939] The complementary binding of VGAM1260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1260 host target RNA into VGAM1260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[44940] It is appreciated that VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1260 host target genes. The mRNA of each one of this plurality of VGAM1260 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1260 RNA, herein designated VGAM RNA, and which when bound by VGAM1260 RNA causes inhibition of translation of respective one or more VGAM1260 host target proteins.

[44941] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1260 gene, herein designated VGAM GENE, on one or more VGAM1260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44942] It is yet further appreciated that a function of VGAM1260 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of viral infection by Blackcurrant Reversion Virus. Specific functions, and accordingly utilities, of VGAM1260 correlate with, and may be deduced from, the identity of the host target genes which VGAM1260 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44943] Nucleotide sequences of the VGAM1260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1260 are further described hereinbelow with reference to Table 1.

[44944] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1260 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44945] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1260 gene, herein designated VGAM is inhibition of expression of VGAM1260 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1260 correlate with, and may be deduced from, the identity of the target genes which VGAM1260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44946] BLAME (Accession NM_020125) is a VGAM1260 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21311, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ

ID:3971.

[44947] A function of VGAM1260 is therefore inhibition of BLAME (Accession NM_020125). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326) is another VGAM1260 host target gene. MAPRE3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAPRE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE3 BINDING SITE, designated SEQ ID:14710, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44948] Another function of VGAM1260 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 3 (MAPRE3, Accession NM_012326), a gene which interact with cytoplasmic microtubules, and with the adenomatous polyposis coli. Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPRE3. The function of

MAPRE3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession NM_005740) is another VGAM1260 host target gene. DNAL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAL4 BINDING SITE, designated SEQ ID:12305, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44949] Another function of VGAM1260 is therefore inhibition of Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession NM_005740). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAL4. FLJ10922 (Accession NM_018273) is another VGAM1260 host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20252, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44950] Another function of VGAM1260 is therefore inhibition of FLJ10922 (Accession NM_018273). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. FLJ11286 (Accession NM_018381) is another VGAM1260 host target gene. FLJ11286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11286 BINDING SITE, designated SEQ ID:20413, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44951] Another function of VGAM1260 is therefore inhibition of FLJ11286 (Accession NM_018381). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11286. KIAA0789 (Accession XM_033113) is another VGAM1260 host target gene. KIAA0789 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0789 BINDING SITE, designated SEQ ID:31844, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44952] Another function of VGAM1260 is therefore inhibition of KIAA0789 (Accession XM_033113). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0789. KIAA1856 (Accession XM_166549) is another VGAM1260 host target gene. KIAA1856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1856 BINDING SITE, designated SEQ ID:44522, to the

nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44953] Another function of VGAM1260 is therefore inhibition of KIAA1856 (Accession XM_166549). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1856. MGC3248 (Accession NM_032486) is another VGAM1260 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26239, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44954] Another function of VGAM1260 is therefore inhibition of MGC3248 (Accession NM_032486). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. ODZ2 (Accession XM_047995) is another VGAM1260 host target gene. ODZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by ODZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODZ2 BINDING SITE, designated SEQ ID:35098, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44955] Another function of VGAM1260 is therefore inhibition of ODZ2 (Accession XM_047995). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODZ2. PP1665 (Accession NM_030792) is another VGAM1260 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:25089, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44956] Another function of VGAM1260 is therefore inhibition of PP1665 (Accession NM_030792). Accordingly, utilities of

VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. LOC163231 (Accession XM_092094) is another VGAM1260 host target gene. LOC163231 BINDING SITE1 and LOC163231 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC163231, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163231 BINDING SITE1 and LOC163231 BINDING SITE2, designated SEQ ID:40095 and SEQ ID:40096 respectively, to the nucleotide sequence of VGAM1260 RNA, herein designated VGAM RNA, also designated SEQ ID:3971.

[44957] Another function of VGAM1260 is therefore inhibition of LOC163231 (Accession XM_092094). Accordingly, utilities of VGAM1260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1261 (VGAM1261) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[44958] VGAM1261 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1261 was detected is described hereinabove with reference to Figs. 1–8.

[44959] VGAM1261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant Reversion Virus. VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44960] VGAM1261 gene encodes a VGAM1261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1261 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1261 precursor RNA is designated SEQ ID:1247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1247 is located at position 2798 relative to the genome of Blackcurrant Reversion Virus.

[44961] VGAM1261 precursor RNA folds onto itself, forming VGAM1261 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44962] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1261 folded precursor RNA into VGAM1261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1261 RNA is designated SEQ ID:3972, and is provided hereinbelow with reference to the sequence listing part.

[44963] VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1261 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44964] VGAM1261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1261 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44965] The complementary binding of VGAM1261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1261 host target RNA into VGAM1261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44966] It is appreciated that VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1261 host target genes. The mRNA of each one of this plurality of VGAM1261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1261 RNA, herein designated VGAM RNA, and which when bound by VGAM1261 RNA causes inhibition of translation of respective one or more VGAM1261 host target proteins.

[44967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1261 gene, herein designated VGAM GENE, on one or more VGAM1261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44968] It is yet further appreciated that a function of VGAM1261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1261 include diagnosis, prevention and treatment of viral infection by Blackcurrant Reversion Virus. Specific functions, and accordingly utilities, of VGAM1261 correlate with, and may be deduced from, the identity of the host target genes which VGAM1261 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[44969] Nucleotide sequences of the VGAM1261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1261 are further described hereinbelow with reference to Table 1.

[44970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1261 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1261 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44971] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1261 gene, herein designated VGAM is inhibition of expression of VGAM1261 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1261 correlate with, and may be deduced from, the identity of the target genes which VGAM1261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44972] FLJ21168 (Accession NM_025073) is a VGAM1261 host target gene. FLJ21168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:24671, to the nucleotide sequence of VGAM1261 RNA, herein designated VGAM RNA, also designated SEQ ID:3972.

[44973] A function of VGAM1261 is therefore inhibition of FLJ21168 (Accession NM_025073). Accordingly, utilities of VGAM1261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21168. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1262 (VGAM1262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44974] VGAM1262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1262 was detected is described hereinabove with reference to Figs. 1–8.

[44975] VGAM1262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Blackcurrant Reversion Virus. VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44976] VGAM1262 gene encodes a VGAM1262 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1262 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1262 precursor RNA is designated SEQ ID:1248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1248 is located at position 3891 relative to the genome of Blackcurrant Reversion Virus.

[44977] VGAM1262 precursor RNA folds onto itself, forming VGAM1262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44978] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1262 folded precursor RNA into VGAM1262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1262 RNA is designated SEQ ID:3973, and is provided hereinbelow with reference to the sequence listing part.

[44979] VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1262 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44980] VGAM1262 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1262 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[44981] The complementary binding of VGAM1262 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1262 host target RNA into VGAM1262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[44982] It is appreciated that VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1262 host target genes. The mRNA of each one of this plurality of VGAM1262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1262 RNA, herein designated VGAM RNA, and which when bound by VGAM1262 RNA causes inhibition of translation of respective one or more VGAM1262 host target proteins.

[44983] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1262 gene, herein designated VGAM GENE, on one or more VGAM1262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[44984] It is yet further appreciated that a function of VGAM1262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1262 include diagnosis, prevention and treatment of viral infection by Blackcurrant Reversion Virus. Specific functions, and accordingly utilities, of VGAM1262 correlate with, and may be deduced from, the identity of the host target genes which VGAM1262 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[44985] Nucleotide sequences of the VGAM1262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1262 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1262 are further described hereinbelow with reference to Table 1.

[44986] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1262 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[44987] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1262 gene, herein designated VGAM is inhibition of expression of VGAM1262 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1262 correlate with, and may be deduced from, the identity of the target genes which VGAM1262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[44988] CD28 Antigen (Tp44) (CD28, Accession NM_006139) is a VGAM1262 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD28, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12780, to the nucleotide sequence of VGAM1262 RNA, herein designated VGAM RNA, also designated SEQ ID:3973.

[44989] A function of VGAM1262 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM1262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281.LOC148371 (Accession XM_086164) is another VGAM1262 host target gene. LOC148371 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148371 BINDING SITE, designated SEQ ID:38525, to the nucleotide sequence of

VGAM1262 RNA, herein designated VGAM RNA, also designated SEQ ID:3973.

[44990] Another function of VGAM1262 is therefore inhibition of LOC148371 (Accession XM_086164). Accordingly, utilities of VGAM1262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148371. LOC221838 (Accession XM_166521) is another VGAM1262 host target gene. LOC221838 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221838 BINDING SITE, designated SEQ ID:44458, to the nucleotide sequence of VGAM1262 RNA, herein designated VGAM RNA, also designated SEQ ID:3973.

[44991] Another function of VGAM1262 is therefore inhibition of LOC221838 (Accession XM_166521). Accordingly, utilities of VGAM1262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221838. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1263 (VGAM1263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[44992] VGAM1263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1263 was detected is described hereinabove with reference to Figs. 1–8.

[44993] VGAM1263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[44994] VGAM1263 gene encodes a VGAM1263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1263 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1263 precursor RNA is designated SEQ ID:1249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1249 is located at position 1764 relative to the genome of Beet Soil-borne Mosaic Virus.

[44995] VGAM1263 precursor RNA folds onto itself, forming VGAM1263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[44996] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1263 folded precursor RNA into VGAM1263 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1263 RNA is designated SEQ ID:3974, and is provided hereinbelow with reference to the sequence listing part.

[44997] VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1263 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1263 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[44998] VGAM1263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1263 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[44999] The complementary binding of VGAM1263 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1263 host target RNA into VGAM1263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45000] It is appreciated that VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1263 host target genes. The mRNA of each one of this plurality of VGAM1263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1263 RNA, herein designated VGAM RNA, and which when bound by VGAM1263 RNA causes inhibition of translation of respective one or more VGAM1263 host target proteins.

[45001] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1263 gene, herein designated VGAM GENE, on one or more VGAM1263 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45002] It is yet further appreciated that a function of VGAM1263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1263 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45003] Nucleotide sequences of the VGAM1263 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1263 are further described hereinbelow with reference to Table 1.

[45004] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1263 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45005] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1263 gene, herein designated VGAM is inhibition of expression of VGAM1263 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1263 correlate with, and may be deduced from, the identity of the target genes which VGAM1263

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45006] Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 8 (SLC7A8, Accession NM_012244) is a VGAM1263 host target gene. SLC7A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A8 BINDING SITE, designated SEQ ID:14552, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45007] A function of VGAM1263 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 8 (SLC7A8, Accession NM_012244), a gene which helps mediate transport of large and small neutral amino acids. Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A8. The function of SLC7A8 has been established by previous studies. Amino acid transport occurs through several systems, including systems L and γ^+ L. System L mediates high-affinity,

sodium-independent, and trans-stimulated transport of large zwitterionic amino acids. LAT1 (SLC7A5; 600182), y(+)LAT1 (SLC7A7; 603593), and y(+)LAT2 (SLC7A6; 605641) have been identified as light chains of the heterodimeric cell surface antigen 4F2. These subunits induce amino acid transport activity in association with the heavy chain of 4F2 (MDU1; 158070). By searching an EST database with the amino acid sequence of SLC7A5, Borsani et al. (1999) identified an EST corresponding to SLC7A8, a novel gene that encodes a protein sharing significant sequence identity with SLC7A5.

[45008] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45009] Borsani, G.; Bassi, M. T.; Sperandeo, M. P.; De Grandi, A.; Buoninconti, A.; Riboni, M.; Manzoni, M.; Incerti, B.; Pepe, A.; Andria, G.; Ballabio, A.; Sebastio, G. : SLC7A7, encoding a putative permease-related protein, is mutated in patients with lysinuric protein intolerance. *Nature Genet.* 21: 297-301, 1999. ; and

[45010] Pineda, M.; Fernandez, E.; Torrents, D.; Estevez, R.; Lopez, C.; Camps, M.; Lloberas, J.; Zorzano, A.; Palacin, M. : Identification of a membrane protein, LAT-2, that co-

expresses with 4F2.

[45011] Further studies establishing the function and utilities of SLC7A8 are found in John Hopkins OMIM database record ID 604235, and in cited publications numbered 156 and 12054 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ERAP140 (Accession XM_059748) is another VGAM1263 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37088, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45012] Another function of VGAM1263 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. KIAA0865 (Accession XM_028522) is another VGAM1263 host target gene. KIAA0865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0865 BINDING SITE, designated SEQ ID:30711, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45013] Another function of VGAM1263 is therefore inhibition of KIAA0865 (Accession XM_028522). Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0865. KIAA1550 (Accession XM_039393) is another VGAM1263 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33068, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45014] Another function of VGAM1263 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities

of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. KIAA1715 (Accession XM_042834) is another VGAM1263 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33790, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45015] Another function of VGAM1263 is therefore inhibition of KIAA1715 (Accession XM_042834). Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. Neuronal Pentraxin Receptor (NPTXR, Accession NM_014293) is another VGAM1263 host target gene. NPTXR BINDING SITE1 and NPTXR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NPTXR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NPTXR BINDING SITE1 and NPTXR BINDING SITE2, designated SEQ ID:15582 and SEQ ID:27730 respectively, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45016] Another function of VGAM1263 is therefore inhibition of Neuronal Pentraxin Receptor (NPTXR, Accession NM_014293). Accordingly, utilities of VGAM1263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTXR. LOC253891 (Accession XM_170485) is another VGAM1263 host target gene. LOC253891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253891 BINDING SITE, designated SEQ ID:45322, to the nucleotide sequence of VGAM1263 RNA, herein designated VGAM RNA, also designated SEQ ID:3974.

[45017] Another function of VGAM1263 is therefore inhibition of LOC253891 (Accession XM_170485). Accordingly, utilities of VGAM1263 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC253891. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1264 (VGAM1264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45018] VGAM1264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1264 was detected is described hereinabove with reference to Figs. 1–8.

[45019] VGAM1264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45020] VGAM1264 gene encodes a VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1264 precursor RNA is desig-

nated SEQ ID:1250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1250 is located at position 1403 relative to the genome of Beet Soil-borne Mosaic Virus.

- [45021] VGAM1264 precursor RNA folds onto itself, forming VGAM1264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45022] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1264 folded precursor RNA into VGAM1264 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1264 RNA is designated SEQ ID:3975, and is provided hereinbelow with reference to the sequence

listing part.

[45023] VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1264 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45024] VGAM1264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1264 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1264 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45025] The complementary binding of VGAM1264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1264 host target RNA into VGAM1264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45026] It is appreciated that VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1264 host target genes. The mRNA of each one of this plurality of VGAM1264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1264 RNA, herein designated VGAM

RNA, and which when bound by VGAM1264 RNA causes inhibition of translation of respective one or more VGAM1264 host target proteins.

[45027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1264 gene, herein designated VGAM GENE, on one or more VGAM1264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45028] It is yet further appreciated that a function of VGAM1264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1264 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1264 correlate with, and may be deduced from, the identity of the host target genes which VGAM1264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45029] Nucleotide sequences of the VGAM1264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1264 are further described hereinbelow with reference to Table 1.

[45030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1264 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45031] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1264 gene, herein designated VGAM is

inhibition of expression of VGAM1264 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1264 correlate with, and may be deduced from, the identity of the target genes which VGAM1264 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45032] Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357) is a VGAM1264 host target gene. CASP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP8 BINDING SITE, designated SEQ ID:27209, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45033] A function of VGAM1264 is therefore inhibition of Caspase 8, Apoptosis-related Cysteine Protease (CASP8, Accession NM_033357), a gene which is an apoptosis-related caspase and an upstream component of Fas receptor and tumor necrosis factor (TNF) receptor-induced apoptosis. Accordingly, utilities of VGAM1264 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with CASP8. The function of CASP8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM145. Interferon Regulatory Factor 1 (IRF1, Accession XM_034862) is another VGAM1264 host target gene. IRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF1 BINDING SITE, designated SEQ ID:32175, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45034] Another function of VGAM1264 is therefore inhibition of Interferon Regulatory Factor 1 (IRF1, Accession XM_034862), a gene which specifically binds to the upstream regulatory region of type I IFN and IFN-inducible MHC class I genes. Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF1. The function of IRF1 has been established by previous studies. In the

course of studies of the regulation of type I interferon gene expression (147660, 147640), Miyamoto et al. (1988) identified a nuclear factor, termed interferon regulatory factor-1 (IRF1), that binds to the upstream cis elements of both the interferon- α and the interferon- β genes. It was found that IRF1 functions as a transcriptional activator for the type I IFN genes (Harada et al., 1990). Harada et al. (1989) found that another factor, IRF2 (OMIM Ref. No. 147576), apparently antagonizes the IRF1 effect by competing for the same cis elements. By linkage studies using RFLPs, the IRF1 gene was assigned to 5q23-q31. To assess the possible role of IRF1 in the regulation of cell growth and differentiation, Yamada et al. (1991) generated transgenic mice carrying the human IRF1 gene, the constitutive expression of which was driven at a high level by the juxtaposed human immunoglobulin heavy-chain enhancer. They found that these transgenic mice showed a dramatic reduction in the number of B lymphocytes. Itoh et al. (1991) also mapped IRF1 to chromosome 5 by analysis of mouse-human somatic cell hybrids. Loss of heterozygosity (LOH) at the IRF1 locus occurs frequently in human gastric cancer (OMIM Ref. No. 137215) (Tamura et al., 1996). Nozawa et al. (1998) iden-

tified a point mutation in a human gastric cancer cell line (147575.0001) that changed methionine at codon 8 to leucine and produced an IRF1 protein with reduced transcriptional activity, but unaltered DNA-binding activity. In addition, Harada et al. (1994) had observed alternative splicing of IRF1 mRNA, producing nonfunctional IRF1 protein at high frequencies in patients with myelodysplastic syndrome and acute myelogenous leukemia. Animal model experiments lend further support to the function of IRF1. Ko et al. (2002) noted that *Irf1* $-/-$ mice are deficient in Inos (OMIM Ref. No. 163730), *Il12b* (OMIM Ref. No. 161561), Cd8 (see OMIM Ref. No. 186910)-positive T cells, and natural killer (NK) cells, whereas *Irf2* $-/-$ mice are deficient in NK cells and have dysregulated *Il12b* induction. *Icsbp* (OMIM Ref. No. 601565) $-/-$ mice are deficient in *Il12b*, *Irf2*, and reactive oxygen intermediates (ROIs). The *Irf1*, *Irf2*, and *Icsbp* genes are all inducible by gamma-interferon (*Ifng*; 147570). *Irf1* $-$, *Irf2 $-$, and *Icsbp*-deficient mouse strains have varying susceptibility to different intracellular bacterial and protozoan pathogens. Ko et al. (2002) determined that *Irf1* $-/-$ mice are highly susceptible to fatal liver damage from *Brucella abortus*, the causative agent of brucellosis, which manifests as arthri-*

tis, endocarditis, and meningitis in humans. In contrast, *Irf2* $-/-$ mice are highly resistant to *Brucella*, whereas *Icsbp* $-/-$ mice maintain a plateau of infection similar to that seen in *Il12b* $-/-$ mice. The authors concluded that IL12, reactive nitrogen intermediates, and ROIs are probably crucial immune components in resistance to *Brucella* infection.

[45035] It is appreciated that the abovementioned animal model for IRF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[45036] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Nat. Acad. Sci.* 88: 532–536, 1991. ; and

[45038] Ko, J.; Gendron-Fitzpatrick, A.; Splitter, G. A. : Susceptibility of IFN regulatory factor-1 and IFN consensus sequence binding protein-deficient mice to brucellosis. *J. Immun.*

168: 2433.

[45039] Further studies establishing the function and utilities of IRF1 are found in John Hopkins OMIM database record ID 147575, and in cited publications numbered 4814, 338 and 3388–3396 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Mitogen–activated Protein Kinase 4 (MAPK4, Accession NM_002747) is another VGAM1264 host target gene. MAPK4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK4 BINDING SITE, designated SEQ ID:8623, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45040] Another function of VGAM1264 is therefore inhibition of Mitogen–activated Protein Kinase 4 (MAPK4, Accession NM_002747), a gene which phosphorylates microtubule–associated protein–2 may promote entry into the cell cycle. Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical condi–

tions associated with MAPK4. The function of MAPK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM655. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889) is another VGAM1264 host target gene. NR1I2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR1I2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE, designated SEQ ID:9974, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45041] Another function of VGAM1264 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_003889), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 and its association with various diseases and clinical

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM336.TEM6 (Accession NM_022748) is another VGAM1264 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22966, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45042] Another function of VGAM1264 is therefore inhibition of TEM6 (Accession NM_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.Zinc Finger Protein 14 (KOX 6) (ZNF14, Accession NM_021030) is another VGAM1264 host target gene. ZNF14 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by ZNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF14 BINDING SITE, designated SEQ ID:22017, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45043] Another function of VGAM1264 is therefore inhibition of Zinc Finger Protein 14 (KOX 6) (ZNF14, Accession NM_021030). Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF14. Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043) is another VGAM1264 host target gene. CGB5 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB5 BINDING SITE, designated SEQ ID:26932, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45044] Another function of VGAM1264 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043). Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB5. DKFZp434M0331 (Accession NM_017600) is another VGAM1264 host target gene. DKFZp434M0331 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434M0331, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434M0331 BINDING SITE, designated SEQ ID:19074, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45045] Another function of VGAM1264 is therefore inhibition of DKFZp434M0331 (Accession NM_017600). Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434M0331. DKFZp547I224 (Accession NM_020221) is another VGAM1264 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21481, to the nucleotide sequence of VGAM1264 RNA, herein designated VGAM RNA, also designated SEQ ID:3975.

[45046] Another function of VGAM1264 is therefore inhibition of DKFZp547I224 (Accession NM_020221). Accordingly, utilities of VGAM1264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1265 (VGAM1265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45047] VGAM1265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1265 was detected is described hereinabove with reference to Figs. 1–8.

[45048] VGAM1265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45049] VGAM1265 gene encodes a VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1265 precursor RNA is designated SEQ ID:1251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1251 is located at position 275 relative to the genome of Beet Soil-borne Mosaic Virus.

[45050] VGAM1265 precursor RNA folds onto itself, forming VGAM1265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[45051] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1265 folded precursor RNA into VGAM1265 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1265 RNA is designated SEQ ID:3976, and is provided hereinbelow with reference to the sequence listing part.

[45052] VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1265 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45053] VGAM1265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1265 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1265 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45054] The complementary binding of VGAM1265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1265 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1265 host target RNA into VGAM1265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45055] It is appreciated that VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1265 host target genes. The mRNA of each one of this plurality of VGAM1265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1265 RNA, herein designated VGAM RNA, and which when bound by VGAM1265 RNA causes inhibition of translation of respective one or more VGAM1265 host target proteins.

[45056] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1265 gene, herein designated VGAM GENE, on one or more VGAM1265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45057] It is yet further appreciated that a function of VGAM1265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1265 correlate with, and may be deduced from, the identity of the host target genes which VGAM1265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45058] Nucleotide sequences of the VGAM1265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1265 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1265 are further described hereinbelow with reference to Table 1.

[45059] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1265 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45060] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1265 gene, herein designated VGAM is inhibition of expression of VGAM1265 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1265 correlate with, and may be deduced from, the identity of the target genes which VGAM1265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45061] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497) is a VGAM1265 host target gene. B4GALT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT1 BINDING SITE, designated SEQ ID:7249, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45062] A function of VGAM1265 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 1 (B4GALT1, Accession NM_001497). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT1. Ribosomal Protein L15 (RPL15, Accession NM_002948) is another VGAM1265 host target gene. RPL15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:8862, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45063] Another function of VGAM1265 is therefore inhibition of Ribosomal Protein L15 (RPL15, Accession NM_002948). Accordingly, utilities of VGAM1265 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with RPL15. Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999) is another VGAM1265 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8895, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45064] Another function of VGAM1265 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM_002999), a gene which is a cell surface proteoglycan. Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.AND-1 (Accession NM_007086) is another VGAM1265 host target gene. AND-1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by AND-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AND-1 BINDING SITE, designated SEQ ID:13956, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45065] Another function of VGAM1265 is therefore inhibition of AND-1 (Accession NM_007086). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AND-1. Formyltetrahydrofolate Dehydrogenase (FTHFD, Accession NM_012190) is another VGAM1265 host target gene. FTHFD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FTHFD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FTHFD BINDING SITE, designated SEQ ID:14480, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45066] Another function of VGAM1265 is therefore inhibition of Formyltetrahydrofolate Dehydrogenase (FTHFD, Accession NM_012190). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FTHFD. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 6 (GalNAc-T6) (GALNT6, Accession NM_007210) is another VGAM1265 host target gene. GALNT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT6 BINDING SITE, designated SEQ ID:14072, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45067] Another function of VGAM1265 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 6 (GalNAc-T6) (GALNT6, Accession NM_007210). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

GALNT6. KIAA0836 (Accession XM_035390) is another VGAM1265 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32250, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45068] Another function of VGAM1265 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA1322 (Accession XM_052626) is another VGAM1265 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36029, to the nucleotide sequence of VGAM1265 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3976.

[45069] Another function of VGAM1265 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567) is another VGAM1265 host target gene. OSBPL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL5 BINDING SITE, designated SEQ ID:35992, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45070] Another function of VGAM1265 is therefore inhibition of Oxysterol Binding Protein-like 5 (OSBPL5, Accession XM_052567). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL5. p25 (Accession NM_007030) is another VGAM1265 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13894, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45071] Another function of VGAM1265 is therefore inhibition of p25 (Accession NM_007030). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. RAGB (Accession NM_016656) is another VGAM1265 host target gene. RAGB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RAGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAGB BINDING SITE, designated SEQ ID:18780, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45072] Another function of VGAM1265 is therefore inhibition of RAGB (Accession NM_016656). Accordingly, utilities of

VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAGB. LOC148114 (Accession XM_086050) is another VGAM1265 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38469, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45073] Another function of VGAM1265 is therefore inhibition of LOC148114 (Accession XM_086050). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148114. LOC152641 (Accession XM_087497) is another VGAM1265 host target gene. LOC152641 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152641 BINDING SITE, designated SEQ ID:39299, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45074] Another function of VGAM1265 is therefore inhibition of LOC152641 (Accession XM_087497). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152641. LOC51696 (Accession NM_016217) is another VGAM1265 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18313, to the nucleotide sequence of VGAM1265 RNA, herein designated VGAM RNA, also designated SEQ ID:3976.

[45075] Another function of VGAM1265 is therefore inhibition of LOC51696 (Accession NM_016217). Accordingly, utilities of VGAM1265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1266 (VGAM1266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45076] VGAM1266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1266 was detected is described hereinabove with reference to Figs. 1–8.

[45077] VGAM1266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic Virus. VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45078] VGAM1266 gene encodes a VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1266 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1266 precursor RNA is designated SEQ ID:1252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1252 is located at position 1065 relative to the

genome of Beet Soil-borne Mosaic Virus.

[45079] VGAM1266 precursor RNA folds onto itself, forming VGAM1266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45080] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1266 folded precursor RNA into VGAM1266 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1266 RNA is designated SEQ ID:3977, and is provided hereinbelow with reference to the sequence listing part.

[45081] VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1266 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[45082] VGAM1266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1266 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45083] The complementary binding of VGAM1266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1266 host target RNA into VGAM1266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45084] It is appreciated that VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1266 host target genes. The mRNA of each one of this plurality of VGAM1266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1266 RNA, herein designated VGAM RNA, and which when bound by VGAM1266 RNA causes inhibition of translation of respective one or more VGAM1266 host target proteins.

[45085] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1266 gene, herein designated VGAM GENE, on one or more VGAM1266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45086] It is yet further appreciated that a function of VGAM1266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of

VGAM1266 correlate with, and may be deduced from, the identity of the host target genes which VGAM1266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45087] Nucleotide sequences of the VGAM1266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1266 are further described hereinbelow with reference to Table 1.

[45088] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1266 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45089] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1266 gene, herein designated VGAM is inhibition of expression of VGAM1266 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1266 correlate with, and may be deduced

from, the identity of the target genes which VGAM1266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45090] CAPON (Accession XM_034002) is a VGAM1266 host target gene. CAPON BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPON, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPON BINDING SITE, designated SEQ ID:31988, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45091] A function of VGAM1266 is therefore inhibition of CAPON (Accession XM_034002), a gene which binds to neuronal nitric oxide synthase and leads to a decreased access to NMDA receptor-gated calcium influx and a catalytically inactive enzyme. Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPON. The function of CAPON has been established by previous studies. Using the first 377 amino acids of neuronal nitric oxide synthase (nNOS; 163731) as bait in a yeast 2-hybrid screen, Jaffrey

et al. (1998) isolated cDNAs encoding CAPON. CAPON appears to have 2 alternate splice forms, one encoding a 125-amino acid protein and the other encoding a 327-amino acid protein. The 125-amino acid C-terminal fragment of CAPON specifically interacted with nNOS in a 2-hybrid system. The full-length cDNA produces a 503-amino acid protein. CAPON displayed no significant homology to any other class of protein except for an N-terminal 145-amino acid stretch that has residues suggestive of a phosphotyrosine-binding (PTB) domain. Northern blot analysis detected a predominant 7.5-kb transcript only in brain regions, with no expression evident in adrenal, bladder, heart, kidney, lung, and skeletal muscle. Marked regional variations occurred in brain, with highest density in the cerebral cortex and medulla oblongata and lowest levels in the hippocampus. CAPON and nNOS interacted in vivo and in vitro and colocalized in rat brain. CAPON was found to compete with PSD95 (OMIM Ref. No. 602887) for interaction with nNOS, and overexpression of CAPON resulted in a loss of PSD95-nNOS complexes in transfected cells. Jaffrey et al. (1998) concluded that CAPON may influence nNOS by regulating its ability to associate with PSD95-NMDA receptor com-

plexes. They proposed a model of PSD95–nNOS regulation by CAPON in which NMDA receptors are coupled to nNOS through a PSD95 multimer; these interactions are mediated by PDZ domains. In this complex, nNOS is situated close to NMDA receptor–modulated calcium influx. Binding of CAPON results in the reduction of NMDA receptor–PSD95–nNOS complexes, leading to a decreased access to NMDA receptor–gated calcium influx and a catalytically inactive enzyme. Seki et al. (1997) mapped the CAPON gene, which they called KIAA0464, to chromosome 1 by radiation hybrid analysis.

[45092] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45093] Jaffrey, S. R.; Snowman, A. M.; Eliasson, M. J. L.; Cohen, N. A.; Snyder, S. H. : CAPON: a protein associated with neuronal nitric oxide synthase that regulates its interactions with PSD95. *Neuron* 115–124, 1998. ; and

[45094] Seki, N.; Ohira, M.; Nagase, T.; Ishikawa, K.; Miyajima, N.; Nakajima, D.; Nomura, N.; Ohara, O. : Characterization of cDNA clones in size–fractionated cDNA libraries from human brain.

[45095] Further studies establishing the function and utilities of

CAPON are found in John Hopkins OMIM database record ID 605551, and in cited publications numbered 6405 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228) is another VGAM1266 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11723, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45096] Another function of VGAM1266 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Interleukin 18 Receptor 1 (IL18R1, Accession NM_003855) is another VGAM1266 host target gene. IL18R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL18R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL18R1 BINDING SITE, designated SEQ ID:9949, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45097] Another function of VGAM1266 is therefore inhibition of Interleukin 18 Receptor 1 (IL18R1, Accession NM_003855), a gene which is required for dorsal-ventral embryonic polarity and promotes heterophilic cellular adhesion. Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL18R1. The function of IL18R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM37.FLJ10081

(Accession NM_017991) is another VGAM1266 host target gene. FLJ10081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10081 BINDING SITE, designated SEQ ID:19723, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45098] Another function of VGAM1266 is therefore inhibition of FLJ10081 (Accession NM_017991). Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10081. FLJ10511 (Accession NM_018120) is another VGAM1266 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:19899, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM

RNA, also designated SEQ ID:3977.

[45099] Another function of VGAM1266 is therefore inhibition of FLJ10511 (Accession NM_018120). Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10511. KIAA0426 (Accession NM_014724) is another VGAM1266 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16308, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45100] Another function of VGAM1266 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. LOC150577 (Accession XM_097918) is another VGAM1266 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150577, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41219, to the nucleotide sequence of VGAM1266 RNA, herein designated VGAM RNA, also designated SEQ ID:3977.

[45101] Another function of VGAM1266 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM1266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1267 (VGAM1267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45102] VGAM1267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1267 was detected is described hereinabove with reference to Figs. 1–8.

[45103] VGAM1267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Soil-borne Mosaic

Virus. VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45104] VGAM1267 gene encodes a VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1267 precursor RNA is designated SEQ ID:1253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1253 is located at position 1249 relative to the genome of Beet Soil-borne Mosaic Virus.

[45105] VGAM1267 precursor RNA folds onto itself, forming VGAM1267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45106] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1267 folded precursor RNA into VGAM1267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1267 RNA is designated SEQ ID:3978, and is provided hereinbelow with reference to the sequence listing part.

[45107] VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1267 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45108] VGAM1267 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1267 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45109] The complementary binding of VGAM1267 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1267 host target RNA into VGAM1267 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45110] It is appreciated that VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1267 host target genes. The mRNA of each one of this plurality of VGAM1267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1267 RNA, herein designated VGAM RNA, and which when bound by VGAM1267 RNA causes inhibition of translation of respective one or more VGAM1267 host target proteins.

[45111] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1267 gene, herein designated VGAM GENE, on one or more VGAM1267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45112] It is yet further appreciated that a function of VGAM1267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of viral infection by Beet Soil-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1267 correlate with, and may be deduced from, the identity of the host target genes which VGAM1267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45113] Nucleotide sequences of the VGAM1267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1267 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1267 are further described hereinbelow with reference to Table 1.

[45114] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1267 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45115] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1267 gene, herein designated VGAM is inhibition of expression of VGAM1267 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1267 correlate with, and may be deduced from, the identity of the target genes which VGAM1267 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45116] Collagen, Type IV, Alpha 6 (COL4A6, Accession NM_001847) is a VGAM1267 host target gene. COL4A6 BINDING SITE1 and COL4A6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A6 BINDING SITE1

and COL4A6 BINDING SITE2, designated SEQ ID:7582 and SEQ ID:27358 respectively, to the nucleotide sequence of VGAM1267 RNA, herein designated VGAM RNA, also designated SEQ ID:3978.

[45117] A function of VGAM1267 is therefore inhibition of Collagen, Type IV, Alpha 6 (COL4A6, Accession NM_001847). Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6. LOC148756 (Accession XM_097516) is another VGAM1267 host target gene. LOC148756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148756 BINDING SITE, designated SEQ ID:40901, to the nucleotide sequence of VGAM1267 RNA, herein designated VGAM RNA, also designated SEQ ID:3978.

[45118] Another function of VGAM1267 is therefore inhibition of LOC148756 (Accession XM_097516). Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC148756. LOC151405 (Accession XM_098058) is another VGAM1267 host target gene. LOC151405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151405 BINDING SITE, designated SEQ ID:41337, to the nucleotide sequence of VGAM1267 RNA, herein designated VGAM RNA, also designated SEQ ID:3978.

[45119] Another function of VGAM1267 is therefore inhibition of LOC151405 (Accession XM_098058). Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151405. LOC221061 (Accession XM_167709) is another VGAM1267 host target gene. LOC221061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221061 BINDING SITE, designated SEQ ID:44770, to the nucleotide sequence of VGAM1267 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3978.

[45120] Another function of VGAM1267 is therefore inhibition of LOC221061 (Accession XM_167709). Accordingly, utilities of VGAM1267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221061. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1268 (VGAM1268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45121] VGAM1268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1268 was detected is described hereinabove with reference to Figs. 1–8.

[45122] VGAM1268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Virus A. VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45123] VGAM1268 gene encodes a VGAM1268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1268 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1268 precursor RNA is designated SEQ ID:1254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1254 is located at position 6970 relative to the genome of Grapevine Virus A.

- [45124] VGAM1268 precursor RNA folds onto itself, forming VGAM1268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45125] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1268 folded precursor RNA into VGAM1268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1268 RNA is designated SEQ ID:3979, and is provided hereinbelow with reference to the sequence listing part.

[45126] VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1268 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45127] VGAM1268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1268 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45128] The complementary binding of VGAM1268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1268 host target RNA into VGAM1268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45129] It is appreciated that VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1268 host target genes. The mRNA of

each one of this plurality of VGAM1268 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1268 RNA, herein designated VGAM RNA, and which when bound by VGAM1268 RNA causes inhibition of translation of respective one or more VGAM1268 host target proteins.

[45130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1268 gene, herein designated VGAM GENE, on one or more VGAM1268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[45131] It is yet further appreciated that a function of VGAM1268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1268 include diagnosis, prevention and treatment of viral infection by Grapevine Virus A. Specific functions, and accordingly utilities, of VGAM1268 correlate with, and may be deduced from, the identity of the host target genes which VGAM1268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45132] Nucleotide sequences of the VGAM1268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1268 are further described hereinbelow with reference to Table 1.

[45133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1268 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1268 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45134] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1268 gene, herein designated VGAM is inhibition of expression of VGAM1268 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1268 correlate with, and may be deduced from, the identity of the target genes which VGAM1268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45135] RNA Binding Motif Protein 3 (RBM3, Accession XM_047024) is a VGAM1268 host target gene. RBM3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RBM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM3 BINDING SITE, designated SEQ ID:34893, to the nucleotide sequence of VGAM1268 RNA, herein designated VGAM RNA, also designated SEQ ID:3979.

[45136] A function of VGAM1268 is therefore inhibition of RNA Binding Motif Protein 3 (RBM3, Accession XM_047024). Accordingly, utilities of VGAM1268 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with RBM3. KIAA0523 (Accession XM_041964) is another VGAM1268 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33643, to the nucleotide sequence of VGAM1268 RNA, herein designated VGAM RNA, also designated SEQ ID:3979.

[45137] Another function of VGAM1268 is therefore inhibition of KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM1268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 10 (PSMD10, Accession NM_002814) is another VGAM1268 host target gene. PSMD10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PSMD10 BINDING SITE, designated SEQ ID:8679, to the nucleotide sequence of VGAM1268 RNA, herein designated VGAM RNA, also designated SEQ ID:3979.

[45138] Another function of VGAM1268 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 10 (PSMD10, Accession NM_002814). Accordingly, utilities of VGAM1268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD10. LOC256107 (Accession XM_173003) is another VGAM1268 host target gene. LOC256107 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256107 BINDING SITE, designated SEQ ID:46275, to the nucleotide sequence of VGAM1268 RNA, herein designated VGAM RNA, also designated SEQ ID:3979.

[45139] Another function of VGAM1268 is therefore inhibition of LOC256107 (Accession XM_173003). Accordingly, utilities of VGAM1268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256107. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1269 (VGAM1269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45140] VGAM1269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1269 was detected is described hereinabove with reference to Figs. 1–8.

[45141] VGAM1269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Virus A. VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45142] VGAM1269 gene encodes a VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1269 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1269 precursor RNA is designated SEQ ID:1255, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1255 is located at position 2009 relative to the genome of Grapevine Virus A.

- [45143] VGAM1269 precursor RNA folds onto itself, forming VGAM1269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1269 folded precursor RNA into VGAM1269 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1269 RNA is designated SEQ ID:3980, and is provided hereinbelow with reference to the sequence listing part.

[45145] VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1269 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45146] VGAM1269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1269 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45147] The complementary binding of VGAM1269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1269 host target RNA into VGAM1269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45148] It is appreciated that VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1269 host target genes. The mRNA of each one of this plurality of VGAM1269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1269 RNA, herein designated VGAM RNA, and which when bound by VGAM1269 RNA causes

inhibition of translation of respective one or more VGAM1269 host target proteins.

[45149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1269 gene, herein designated VGAM GENE, on one or more VGAM1269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45150] It is yet further appreciated that a function of VGAM1269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1269 include diagnosis, prevention and

treatment of viral infection by Grapevine Virus A. Specific functions, and accordingly utilities, of VGAM1269 correlate with, and may be deduced from, the identity of the host target genes which VGAM1269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45151] Nucleotide sequences of the VGAM1269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1269 are further described hereinbelow with reference to Table 1.

[45152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1269 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1269 gene, herein designated VGAM is inhibition of expression of VGAM1269 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1269 correlate with, and may be deduced from, the identity of the target genes which VGAM1269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45154] DKFZp547J036 (Accession NM_032281) is a VGAM1269 host target gene. DKFZp547J036 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp547J036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547J036 BINDING SITE, designated SEQ ID:26040, to the nucleotide sequence of VGAM1269 RNA, herein designated VGAM RNA, also designated SEQ ID:3980.

[45155] A function of VGAM1269 is therefore inhibition of DKFZp547J036 (Accession NM_032281). Accordingly, utilities of VGAM1269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547J036. KIAA1337 (Accession XM_052561) is another VGAM1269 host target gene. KIAA1337 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1337, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1337 BINDING SITE, designated SEQ ID:35983, to the nucleotide sequence of VGAM1269 RNA, herein designated VGAM RNA, also designated SEQ ID:3980.

[45156] Another function of VGAM1269 is therefore inhibition of KIAA1337 (Accession XM_052561). Accordingly, utilities of VGAM1269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1270 (VGAM1270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45157] VGAM1270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1270 was detected is described hereinabove with reference to Figs. 1-8.

[45158] VGAM1270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Virus A.

VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45159] VGAM1270 gene encodes a VGAM1270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1270 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1270 precursor RNA is designated SEQ ID:1256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1256 is located at position 205 relative to the genome of Grapevine Virus A.

[45160] VGAM1270 precursor RNA folds onto itself, forming VGAM1270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45161] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1270 folded precursor RNA into VGAM1270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1270 RNA is designated SEQ ID:3981, and is provided hereinbelow with reference to the sequence listing part.

[45162] VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1270 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45163] VGAM1270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1270 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45164] The complementary binding of VGAM1270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1270 host target RNA into VGAM1270 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45165] It is appreciated that VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1270 host target genes. The mRNA of each one of this plurality of VGAM1270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1270 RNA, herein designated VGAM RNA, and which when bound by VGAM1270 RNA causes inhibition of translation of respective one or more VGAM1270 host target proteins.

[45166] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1270 gene, herein designated VGAM GENE, on one or more VGAM1270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45167] It is yet further appreciated that a function of VGAM1270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of viral infection by Grapevine Virus A. Specific functions, and accordingly utilities, of VGAM1270 correlate with, and may be deduced from, the identity of the host target genes which VGAM1270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45168] Nucleotide sequences of the VGAM1270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1270 are further described hereinbelow with reference to Table 1.

[45169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1270 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45170] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1270 gene, herein designated VGAM is inhibition of expression of VGAM1270 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1270 correlate with, and may be deduced from, the identity of the target genes which VGAM1270 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45171] Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112) is a VGAM1270 host target gene. TRPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPS1 BINDING SITE, designated SEQ ID:15354, to the

nucleotide sequence of VGAM1270 RNA, herein designated VGAM RNA, also designated SEQ ID:3981.

[45172] A function of VGAM1270 is therefore inhibition of Trichorhinophalangeal Syndrome I (TRPS1, Accession NM_014112), a gene which may function as a transcriptional activator protein. Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPS1. The function of TRPS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.DKFZp434O0515 (Accession XM_038277) is another VGAM1270 host target gene. DKFZp434O0515 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434O0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434O0515 BINDING SITE, designated SEQ ID:32787, to the nucleotide sequence of VGAM1270 RNA, herein designated VGAM RNA, also designated SEQ ID:3981.

[45173] Another function of VGAM1270 is therefore inhibition of

DKFZp434O0515 (Accession XM_038277). Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434O0515. LOC148823 (Accession NM_145278) is another VGAM1270 host target gene. LOC148823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148823 BINDING SITE, designated SEQ ID:29794, to the nucleotide sequence of VGAM1270 RNA, herein designated VGAM RNA, also designated SEQ ID:3981.

[45174] Another function of VGAM1270 is therefore inhibition of LOC148823 (Accession NM_145278). Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148823. LOC152316 (Accession XM_098185) is another VGAM1270 host target gene. LOC152316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152316, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152316 BINDING SITE, designated SEQ ID:41452, to the nucleotide sequence of VGAM1270 RNA, herein designated VGAM RNA, also designated SEQ ID:3981.

[45175] Another function of VGAM1270 is therefore inhibition of LOC152316 (Accession XM_098185). Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152316. LOC93444 (Accession XM_051455) is another VGAM1270 host target gene. LOC93444 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93444, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93444 BINDING SITE, designated SEQ ID:35842, to the nucleotide sequence of VGAM1270 RNA, herein designated VGAM RNA, also designated SEQ ID:3981.

[45176] Another function of VGAM1270 is therefore inhibition of LOC93444 (Accession XM_051455). Accordingly, utilities of VGAM1270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93444. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1271 (VGAM1271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45177] VGAM1271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1271 was detected is described hereinabove with reference to Figs. 1–8.

[45178] VGAM1271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Virus A. VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45179] VGAM1271 gene encodes a VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1271 precursor RNA is designated SEQ ID:1257, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1257 is located at position 6496 relative to the genome of Grapevine Virus A.

- [45180] VGAM1271 precursor RNA folds onto itself, forming VGAM1271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1271 folded precursor RNA into VGAM1271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1271 RNA is designated SEQ ID:3982, and is provided hereinbelow with reference to the sequence listing part.

[45182] VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1271 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45183] VGAM1271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1271 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45184] The complementary binding of VGAM1271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1271 host target RNA into VGAM1271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45185] It is appreciated that VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1271 host target genes. The mRNA of each one of this plurality of VGAM1271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1271 RNA, herein designated VGAM RNA, and which when bound by VGAM1271 RNA causes

inhibition of translation of respective one or more VGAM1271 host target proteins.

[45186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1271 gene, herein designated VGAM GENE, on one or more VGAM1271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45187] It is yet further appreciated that a function of VGAM1271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1271 include diagnosis, prevention and

treatment of viral infection by Grapevine Virus A. Specific functions, and accordingly utilities, of VGAM1271 correlate with, and may be deduced from, the identity of the host target genes which VGAM1271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45188] Nucleotide sequences of the VGAM1271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1271 are further described hereinbelow with reference to Table 1.

[45189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1271 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1271 gene, herein designated VGAM is inhibition of expression of VGAM1271 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1271 correlate with, and may be deduced from, the identity of the target genes which VGAM1271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45191] Cyclin D-type Binding-protein 1 (CCNDBP1, Accession NM_037370) is a VGAM1271 host target gene. CCNDBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCNDBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNDBP1 BINDING SITE, designated SEQ ID:27397, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45192] A function of VGAM1271 is therefore inhibition of Cyclin D-type Binding-protein 1 (CCNDBP1, Accession NM_037370). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNDBP1. Phosphotriesterase Related (PTER, Accession NM_030664) is another VGAM1271 host target gene. PTER BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by PTER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:24998, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45193] Another function of VGAM1271 is therefore inhibition of Phosphotriesterase Related (PTER, Accession NM_030664), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER. The function of PTER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM713. Soc-2 Suppressor of Clear Homolog (C. elegans) (SHOC2, Accession NM_007373) is another VGAM1271 host target gene. SHOC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SHOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SHOC2 BINDING SITE, designated SEQ ID:14306, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45194] Another function of VGAM1271 is therefore inhibition of Soc-2 Suppressor of Clear Homolog (*C. elegans*) (SHOC2, Accession NM_007373), a gene which may be a regulator of the let-60 ras pathway. Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHOC2. The function of SHOC2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.DKFZP434I116 (Accession NM_015496) is another VGAM1271 host target gene. DKFZP434I116 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I116 BINDING SITE, designated SEQ ID:17764, to the nucleotide sequence of

VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45195] Another function of VGAM1271 is therefore inhibition of DKFZP434I116 (Accession NM_015496). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I116. FLJ13848 (Accession NM_024771) is another VGAM1271 host target gene. FLJ13848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:24132, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45196] Another function of VGAM1271 is therefore inhibition of FLJ13848 (Accession NM_024771). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848. KIAA1257 (Accession XM_031577) is another VGAM1271 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31436, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45197] Another function of VGAM1271 is therefore inhibition of KIAA1257 (Accession XM_031577). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. LOC128989 (Accession XM_059310) is another VGAM1271 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36945, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45198] Another function of VGAM1271 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities

of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC146894 (Accession NM_145273) is another VGAM1271 host target gene. LOC146894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146894 BINDING SITE, designated SEQ ID:29783, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45199] Another function of VGAM1271 is therefore inhibition of LOC146894 (Accession NM_145273). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146894. LOC150155 (Accession XM_047977) is another VGAM1271 host target gene. LOC150155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150155 BINDING SITE, designated SEQ ID:35090, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45200] Another function of VGAM1271 is therefore inhibition of LOC150155 (Accession XM_047977). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150155. LOC150383 (Accession XM_086905) is another VGAM1271 host target gene. LOC150383 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150383 BINDING SITE, designated SEQ ID:38946, to the nucleotide sequence of VGAM1271 RNA, herein designated VGAM RNA, also designated SEQ ID:3982.

[45201] Another function of VGAM1271 is therefore inhibition of LOC150383 (Accession XM_086905). Accordingly, utilities of VGAM1271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150383. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1272 (VGAM1272) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45202] VGAM1272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1272 was detected is described hereinabove with reference to Figs. 1–8.

[45203] VGAM1272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Virus A. VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45204] VGAM1272 gene encodes a VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1272 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1272 precursor RNA is designated SEQ ID:1258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1258 is located at position 2895 relative to the

genome of Grapevine Virus A.

[45205] VGAM1272 precursor RNA folds onto itself, forming VGAM1272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45206] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1272 folded precursor RNA into VGAM1272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1272 RNA is designated SEQ ID:3983, and is provided hereinbelow with reference to the sequence listing part.

[45207] VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1272 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[45208] VGAM1272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1272 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45209] The complementary binding of VGAM1272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1272 host target RNA into VGAM1272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45210] It is appreciated that VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1272 host target genes. The mRNA of each one of this plurality of VGAM1272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1272 RNA, herein designated VGAM RNA, and which when bound by VGAM1272 RNA causes inhibition of translation of respective one or more VGAM1272 host target proteins.

[45211] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1272 gene, herein designated VGAM GENE, on one or more VGAM1272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45212] It is yet further appreciated that a function of VGAM1272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of viral infection by Grapevine Virus A. Specific functions, and accordingly utilities, of VGAM1272 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1272 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45213] Nucleotide sequences of the VGAM1272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1272 are further described hereinbelow with reference to Table 1.

[45214] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1272 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45215] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1272 gene, herein designated VGAM is inhibition of expression of VGAM1272 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1272 correlate with, and may be deduced

from, the identity of the target genes which VGAM1272 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45216] Deiodinase, Iodothyronine, Type I (DIO1, Accession NM_000792) is a VGAM1272 host target gene. DIO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO1 BINDING SITE, designated SEQ ID:6451, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45217] A function of VGAM1272 is therefore inhibition of Deiodinase, Iodothyronine, Type I (DIO1, Accession NM_000792). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO1. High-mobility Group Box 3 (HMGB3, Accession NM_005342) is another VGAM1272 host target gene. HMGB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGB3 BINDING SITE, designated SEQ ID:11817, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45218] Another function of VGAM1272 is therefore inhibition of High-mobility Group Box 3 (HMGB3, Accession NM_005342), a gene which plays a fundamental role in DNA replication, nucleosome assembly, and transcription. Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGB3. The function of HMGB3 has been established by previous studies. One group of high mobility group (HMG) proteins includes the HMG1 (OMIM Ref. No. 163905) and HMG2 (OMIM Ref. No. 163906) proteins, which appear to play a fundamental role in DNA replication, nucleosome assembly, and transcription. By using direct cDNA selection to identify genes located in human chromosome Xq28, Wilke et al. (1997) cloned cDNAs encoding the human homolog of chicken HMG2a. The predicted 199-amino acid human protein shares 97%, 88%, and 86% identity with chicken HMG2a, human HMG1, and human HMG2, respectively. Like the HMG1 and HMG2

proteins, human HMG2A contains 2 HMG box repeats and an acidic C-terminal domain. Northern blot analysis revealed that HMG2A is expressed predominantly in placenta as 1.2- and 1.7-kb mRNAs. Wilke et al. (1997) also identified ESTs corresponding to the mouse HMG2a homolog. Independently, Vaccari et al. (1998) isolated mouse and human cDNAs corresponding to HGM2A, which they called HMG4. They reported that the deduced mouse and human proteins contain 200 amino acids and are 97% identical. Northern blot and RT-PCR analyses suggested that mouse Hmg4 transcripts are much more abundant in embryonic than in adult tissues.

[45219] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45220] Vaccari, T.; Beltrame, M.; Ferrari, S.; Bianchi, M. E. : Hmg4, a new member of the Hmg1/2 gene family. *Genomics* 49: 247-252, 1998. ; and

[45221] Wilke, K.; Wiemann, S.; Gaul, R.; Gong, W.; Poustka, A. : Isolation of human and mouse HMG2a cDNAs: evidence for an HMG2a-specific 3-prime untranslated region. *Gene* 198: 269-274, 1997.

[45222] Further studies establishing the function and utilities of

HMGB3 are found in John Hopkins OMIM database record ID 300193, and in cited publications numbered 11391–11392 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Integrin, Alpha 6 (ITGA6, Accession NM_000210) is another VGAM1272 host target gene. ITGA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA6 BINDING SITE, designated SEQ ID:5703, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45223] Another function of VGAM1272 is therefore inhibition of Integrin, Alpha 6 (ITGA6, Accession NM_000210). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA6. Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM_000428) is another VGAM1272 host target gene. LTBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTBP2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTBP2 BINDING SITE, designated SEQ ID:6005, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45224] Another function of VGAM1272 is therefore inhibition of Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM_000428), a gene which targets latent TGF-beta to the extracellular matrix. Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBP2. The function of LTBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM1272 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SERPINB9 BINDING SITE, designated SEQ ID:10361, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45225] Another function of VGAM1272 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB9. The function of SERPINB9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257) is another VGAM1272 host target gene. C20orf142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING

SITE, designated SEQ ID:36929, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45226] Another function of VGAM1272 is therefore inhibition of Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033331) is another VGAM1272 host target gene. CDC14B BINDING SITE1 and CDC14B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC14B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE1 and CDC14B BINDING SITE2, designated SEQ ID:27160 and SEQ ID:9757 respectively, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45227] Another function of VGAM1272 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*)

(CDC14B, Accession NM_033331). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Death Associated Transcription Factor 1 (DATF1, Accession NM_080796) is another VGAM1272 host target gene. DATF1 BINDING SITE1 and DATF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DATF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DATF1 BINDING SITE1 and DATF1 BINDING SITE2, designated SEQ ID:28064 and SEQ ID:15317 respectively, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45228] Another function of VGAM1272 is therefore inhibition of Death Associated Transcription Factor 1 (DATF1, Accession NM_080796). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DATF1. FLJ11011 (Accession NM_018299) is another VGAM1272 host target gene. FLJ11011 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by FLJ11011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11011 BINDING SITE, designated SEQ ID:20291, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45229] Another function of VGAM1272 is therefore inhibition of FLJ11011 (Accession NM_018299). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11011. FLJ31153 (Accession NM_144600) is another VGAM1272 host target gene. FLJ31153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:29413, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45230] Another function of VGAM1272 is therefore inhibition of FLJ31153 (Accession NM_144600). Accordingly, utilities of

VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153. HSA250839 (Accession NM_018401) is another VGAM1272 host target gene. HSA250839 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA250839, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA250839 BINDING SITE, designated SEQ ID:20438, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45231] Another function of VGAM1272 is therefore inhibition of HSA250839 (Accession NM_018401). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA250839. KIAA0377 (Accession NM_014659) is another VGAM1272 host target gene. KIAA0377 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0377 BINDING SITE, designated SEQ ID:16103, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45232] Another function of VGAM1272 is therefore inhibition of KIAA0377 (Accession NM_014659). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0377. Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM_004713) is another VGAM1272 host target gene. SDCCAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG1 BINDING SITE, designated SEQ ID:11071, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45233] Another function of VGAM1272 is therefore inhibition of Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM_004713). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SD-

CCAG1. LOC122330 (Accession XM_074145) is another VGAM1272 host target gene. LOC122330 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC122330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122330 BINDING SITE, designated SEQ ID:37517, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45234] Another function of VGAM1272 is therefore inhibition of LOC122330 (Accession XM_074145). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122330. LOC256401 (Accession XM_171149) is another VGAM1272 host target gene. LOC256401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256401 BINDING SITE, designated SEQ ID:45944, to the nucleotide sequence of VGAM1272 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3983.

[45235] Another function of VGAM1272 is therefore inhibition of LOC256401 (Accession XM_171149). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256401. LOC90719 (Accession XM_033704) is another VGAM1272 host target gene. LOC90719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90719 BINDING SITE, designated SEQ ID:31946, to the nucleotide sequence of VGAM1272 RNA, herein designated VGAM RNA, also designated SEQ ID:3983.

[45236] Another function of VGAM1272 is therefore inhibition of LOC90719 (Accession XM_033704). Accordingly, utilities of VGAM1272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1273 (VGAM1273) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45237] VGAM1273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1273 was detected is described hereinabove with reference to Figs. 1–8.

[45238] VGAM1273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A–2 Plaque Virus. VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45239] VGAM1273 gene encodes a VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1273 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1273 precursor RNA is designated SEQ ID:1259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1259 is located at position 7172 relative to the genome of A–2 Plaque Virus.

[45240] VGAM1273 precursor RNA folds onto itself, forming

VGAM1273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45241] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1273 folded precursor RNA into VGAM1273 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1273 RNA is designated SEQ ID:3984, and is provided hereinbelow with reference to the sequence listing part.

[45242] VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1273 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45243] VGAM1273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1273 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45244] The complementary binding of VGAM1273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1273 host target RNA into VGAM1273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45245] It is appreciated that VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1273 host target genes. The mRNA of each one of this plurality of VGAM1273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1273 RNA, herein designated VGAM RNA, and which when bound by VGAM1273 RNA causes inhibition of translation of respective one or more VGAM1273 host target proteins.

[45246] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1273 gene, herein designated VGAM GENE, on one or more VGAM1273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45247] It is yet further appreciated that a function of VGAM1273 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM1273 correlate with, and may be deduced from, the identity of the host target genes which VGAM1273 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[45248] Nucleotide sequences of the VGAM1273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1273 are further described hereinbelow with reference to Table 1.

[45249] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1273 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45250] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1273 gene, herein designated VGAM is inhibition of expression of VGAM1273 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1273 correlate with, and may be deduced from, the identity of the target genes which VGAM1273 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[45251] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093) is a VGAM1273 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11547, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45252] A function of VGAM1273 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Ac-

cession NM_000782) is another VGAM1273 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6430, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45253] Another function of VGAM1273 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM_000782), a gene which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24. The function of CYP24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1204.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397) is another VGAM1273 host target gene.

DDX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10643, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45254] Another function of VGAM1273 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512) is another VGAM1273 host target gene. GALNS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNS, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNS BINDING SITE, designated SEQ ID:6121, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45255] Another function of VGAM1273 is therefore inhibition of Galactosamine (N-acetyl)-6-sulfate Sulfatase (Morquio syndrome, mucopolysaccharidosis type IVA) (GALNS, Accession NM_000512). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNS. Heterogeneous Nuclear Ribonucleoprotein D (AU-rich element RNA binding protein 1, 37kDa) (HNRPD, Accession NM_002138) is another VGAM1273 host target gene. HNRPD BINDING SITE1 and HNRPD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPD BINDING SITE1 and HNRPD BINDING SITE2, designated SEQ ID:7914 and SEQ ID:25364 respectively, to the nucleotide sequence of

VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45256] Another function of VGAM1273 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D (AU-rich element RNA binding protein 1, 37kDa) (HNRPD, Accession NM_002138). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPD. Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149) is another VGAM1273 host target gene. STAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAC BINDING SITE, designated SEQ ID:9118, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45257] Another function of VGAM1273 is therefore inhibition of Src Homology Three (SH3) and Cysteine Rich Domain (STAC, Accession NM_003149), a gene which is probably involved in a neuron-specific signal transduction. Accordingly, utilities of VGAM1273 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with STAC. The function of STAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331. Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM_003316) is another VGAM1273 host target gene. TTC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC3 BINDING SITE, designated SEQ ID:9316, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45258] Another function of VGAM1273 is therefore inhibition of Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM_003316), a gene which contains tetratricopeptide repeat (TPR) motifs. Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC3. The function of TTC3 and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM699. Angiomotin (AMOT, Accession NM_133265) is another VGAM1273 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28417, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45259] Another function of VGAM1273 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 1 (B3GNT1, Accession NM_006577) is another VGAM1273 host target gene. B3GNT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by B3GNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of B3GNT1 BINDING SITE, designated SEQ ID:13343, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45260] Another function of VGAM1273 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 1 (B3GNT1, Accession NM_006577). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT1. DKFZp434E1822 (Accession XM_043624) is another VGAM1273 host target gene. DKFZp434E1822 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434E1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434E1822 BINDING SITE, designated SEQ ID:33983, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45261] Another function of VGAM1273 is therefore inhibition of DKFZp434E1822 (Accession XM_043624). Accordingly,

utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E1822. FLJ20297 (Accession NM_017751) is another VGAM1273 host target gene. FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20297 BINDING SITE1 and FLJ20297 BINDING SITE2, designated SEQ ID:19359 and SEQ ID:19649 respectively, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45262] Another function of VGAM1273 is therefore inhibition of FLJ20297 (Accession NM_017751). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20297. G2 (Accession XM_039515) is another VGAM1273 host target gene. G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:33113, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45263] Another function of VGAM1273 is therefore inhibition of G2 (Accession XM_039515). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2. KIAA0286 (Accession XM_043118) is another VGAM1273 host target gene. KIAA0286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0286 BINDING SITE, designated SEQ ID:33904, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45264] Another function of VGAM1273 is therefore inhibition of KIAA0286 (Accession XM_043118). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0286. Phospholipase A2, Group XII (PLA2G12, Accession NM_030821) is another VGAM1273 host target gene. PLA2G12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G12 BINDING SITE, designated SEQ ID:25150, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45265] Another function of VGAM1273 is therefore inhibition of Phospholipase A2, Group XII (PLA2G12, Accession NM_030821). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G12. SV2B (Accession NM_014848) is another VGAM1273 host target gene. SV2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SV2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SV2B BINDING SITE, designated SEQ ID:16883, to the nu-

cleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45266] Another function of VGAM1273 is therefore inhibition of SV2B (Accession NM_014848). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SV2B. LOC133634 (Accession XM_059664) is another VGAM1273 host target gene. LOC133634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133634 BINDING SITE, designated SEQ ID:37050, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45267] Another function of VGAM1273 is therefore inhibition of LOC133634 (Accession XM_059664). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133634. LOC146146 (Accession XM_085343) is another VGAM1273 host target gene. LOC146146 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC146146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146146 BINDING SITE, designated SEQ ID:38073, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45268] Another function of VGAM1273 is therefore inhibition of LOC146146 (Accession XM_085343). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146146. LOC146452 (Accession XM_085473) is another VGAM1273 host target gene. LOC146452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146452 BINDING SITE, designated SEQ ID:38165, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45269] Another function of VGAM1273 is therefore inhibition of LOC146452 (Accession XM_085473). Accordingly, utilities

of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146452. LOC150630 (Accession XM_097931) is another VGAM1273 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41242, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45270] Another function of VGAM1273 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC150776 (Accession XM_032542) is another VGAM1273 host target gene. LOC150776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150776 BINDING SITE, designated SEQ ID:31676, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45271] Another function of VGAM1273 is therefore inhibition of LOC150776 (Accession XM_032542). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150776. LOC164295 (Accession XM_092767) is another VGAM1273 host target gene. LOC164295 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164295 BINDING SITE, designated SEQ ID:40141, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45272] Another function of VGAM1273 is therefore inhibition of LOC164295 (Accession XM_092767). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164295. LOC203429 (Accession XM_114701) is another VGAM1273 host target gene. LOC203429 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203429 BINDING SITE, designated SEQ ID:43048, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45273] Another function of VGAM1273 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. LOC221272 (Accession XM_168050) is another VGAM1273 host target gene. LOC221272 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE, designated SEQ ID:44964, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45274] Another function of VGAM1273 is therefore inhibition of

LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC91445 (Accession XM_018516) is another VGAM1273 host target gene. LOC91445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91445 BINDING SITE, designated SEQ ID:30372, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45275] Another function of VGAM1273 is therefore inhibition of LOC91445 (Accession XM_018516). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91445. LOC92497 (Accession XM_045436) is another VGAM1273 host target gene. LOC92497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC92497 BINDING SITE, designated SEQ ID:34461, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45276] Another function of VGAM1273 is therefore inhibition of LOC92497 (Accession XM_045436). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92497. LOC92689 (Accession XM_046663) is another VGAM1273 host target gene. LOC92689 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92689 BINDING SITE, designated SEQ ID:34782, to the nucleotide sequence of VGAM1273 RNA, herein designated VGAM RNA, also designated SEQ ID:3984.

[45277] Another function of VGAM1273 is therefore inhibition of LOC92689 (Accession XM_046663). Accordingly, utilities of VGAM1273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92689. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1274 (VGAM1274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45278] VGAM1274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1274 was detected is described hereinabove with reference to Figs. 1–8.

[45279] VGAM1274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A–2 Plaque Virus. VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45280] VGAM1274 gene encodes a VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1274 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1274 precursor RNA is designated SEQ ID:1260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1260 is located at position 5481 relative to the genome of A-2 Plaque Virus.

[45281] VGAM1274 precursor RNA folds onto itself, forming VGAM1274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45282] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1274 folded precursor RNA into VGAM1274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1274 RNA is designated SEQ ID:3985, and is provided hereinbelow with reference to the sequence listing part.

[45283] VGAM1274 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1274 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45284] VGAM1274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1274 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1274 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[45285] The complementary binding of VGAM1274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1274 host target RNA into VGAM1274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45286] It is appreciated that VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1274 host target genes. The mRNA of each one of this plurality of VGAM1274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1274 RNA, herein designated VGAM RNA, and which when bound by VGAM1274 RNA causes inhibition of translation of respective one or more

VGAM1274 host target proteins.

[45287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1274 gene, herein designated VGAM GENE, on one or more VGAM1274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45288] It is yet further appreciated that a function of VGAM1274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific

functions, and accordingly utilities, of VGAM1274 correlate with, and may be deduced from, the identity of the host target genes which VGAM1274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45289] Nucleotide sequences of the VGAM1274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1274 are further described hereinbelow with reference to Table 1.

[45290] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1274 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45291] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1274 gene, herein designated VGAM is inhibition of expression of VGAM1274 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1274 correlate with, and may be deduced from, the identity of the target genes which VGAM1274 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45292] Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949) is a VGAM1274 host target gene. INPP5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5B BINDING SITE, designated SEQ ID:45735, to the nucleotide sequence of VGAM1274 RNA, herein designated VGAM RNA, also designated SEQ ID:3985.

[45293] A function of VGAM1274 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949), a gene which hydrolyzes the calcium-mobilizing second messenger $\text{ins}(1,4,5)\text{p3}$. Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5B. The function of INPP5B and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM50.FLJ23790 (Accession NM_144963) is another VGAM1274 host target gene. FLJ23790 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23790 BINDING SITE, designated SEQ ID:29579, to the nucleotide sequence of VGAM1274 RNA, herein designated VGAM RNA, also designated SEQ ID:3985.

[45294] Another function of VGAM1274 is therefore inhibition of FLJ23790 (Accession NM_144963). Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23790. KIAA0493 (Accession XM_034717) is another VGAM1274 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0493 BINDING SITE, designated SEQ ID:32138, to the nucleotide sequence of VGAM1274 RNA, herein designated VGAM RNA, also designated SEQ ID:3985.

[45295] Another function of VGAM1274 is therefore inhibition of KIAA0493 (Accession XM_034717). Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0596 (Accession XM_031706) is another VGAM1274 host target gene. KIAA0596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE, designated SEQ ID:31460, to the nucleotide sequence of VGAM1274 RNA, herein designated VGAM RNA, also designated SEQ ID:3985.

[45296] Another function of VGAM1274 is therefore inhibition of KIAA0596 (Accession XM_031706). Accordingly, utilities of VGAM1274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0596. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1275 (VGAM1275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45297] VGAM1275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1275 was detected is described hereinabove with reference to Figs. 1–8.

[45298] VGAM1275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A–2 Plaque Virus. VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45299] VGAM1275 gene encodes a VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1275 precursor RNA is designated SEQ ID:1261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1261 is located at position 5027 relative to the

genome of A-2 Plaque Virus.

[45300] VGAM1275 precursor RNA folds onto itself, forming VGAM1275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45301] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1275 folded precursor RNA into VGAM1275 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1275 RNA is designated SEQ ID:3986, and is provided hereinbelow with reference to the sequence listing part.

[45302] VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1275 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[45303] VGAM1275 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1275 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45304] The complementary binding of VGAM1275 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1275 host target RNA into VGAM1275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45305] It is appreciated that VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1275 host target genes. The mRNA of each one of this plurality of VGAM1275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1275 RNA, herein designated VGAM RNA, and which when bound by VGAM1275 RNA causes inhibition of translation of respective one or more VGAM1275 host target proteins.

[45306] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1275 gene, herein designated VGAM GENE, on one or more VGAM1275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45307] It is yet further appreciated that a function of VGAM1275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM1275 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45308] Nucleotide sequences of the VGAM1275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1275 are further described hereinbelow with reference to Table 1.

[45309] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1275 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45310] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1275 gene, herein designated VGAM is inhibition of expression of VGAM1275 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1275 correlate with, and may be deduced

from, the identity of the target genes which VGAM1275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45311] Myosin IC (MYO1C, Accession XM_028385) is a VGAM1275 host target gene. MYO1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1C BINDING SITE, designated SEQ ID:30695, to the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, also designated SEQ ID:3986.

[45312] A function of VGAM1275 is therefore inhibition of Myosin IC (MYO1C, Accession XM_028385), a gene which participates in adaptation in hair cells. Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1C. The function of MYO1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.FLJ20209 (Accession XM_098142) is another VGAM1275 host target gene. FLJ20209 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20209 BINDING SITE, designated SEQ ID:41401, to the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, also designated SEQ ID:3986.

[45313] Another function of VGAM1275 is therefore inhibition of FLJ20209 (Accession XM_098142). Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20209. FLJ21919 (Accession NM_023015) is another VGAM1275 host target gene. FLJ21919 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21919 BINDING SITE, designated SEQ ID:23277, to the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, also designated SEQ ID:3986.

[45314] Another function of VGAM1275 is therefore inhibition of

FLJ21919 (Accession NM_023015). Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21919. FLJ30678 (Accession NM_144657) is another VGAM1275 host target gene. FLJ30678 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ30678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30678 BINDING SITE, designated SEQ ID:29479, to the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, also designated SEQ ID:3986.

[45315] Another function of VGAM1275 is therefore inhibition of FLJ30678 (Accession NM_144657). Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30678. FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513) is another VGAM1275 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23706, to the nucleotide sequence of VGAM1275 RNA, herein designated VGAM RNA, also designated SEQ ID:3986.

[45316] Another function of VGAM1275 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM1275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1276 (VGAM1276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45317] VGAM1276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1276 was detected is described hereinabove with reference to Figs. 1–8.

[45318] VGAM1276 gene, herein designated VGAM GENE, is a viral gene contained in the genome of A-2 Plaque Virus. VGAM1276 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[45319] VGAM1276 gene encodes a VGAM1276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1276 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1276 precursor RNA is designated SEQ ID:1262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1262 is located at position 6716 relative to the genome of A-2 Plaque Virus.

[45320] VGAM1276 precursor RNA folds onto itself, forming VGAM1276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45321] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1276 folded precursor RNA into VGAM1276

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1276 RNA is designated SEQ ID:3987, and is provided hereinbelow with reference to the sequence listing part.

[45322] VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1276 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45323] VGAM1276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1276 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45324] The complementary binding of VGAM1276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1276 host target RNA into VGAM1276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[45325] It is appreciated that VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1276 host target genes. The mRNA of each one of this plurality of VGAM1276 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1276 RNA, herein designated VGAM RNA, and which when bound by VGAM1276 RNA causes inhibition of translation of respective one or more VGAM1276 host target proteins.

[45326] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1276 gene, herein designated VGAM GENE, on one or more VGAM1276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45327] It is yet further appreciated that a function of VGAM1276 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of viral infection by A-2 Plaque Virus. Specific functions, and accordingly utilities, of VGAM1276 correlate with, and may be deduced from, the identity of the host target genes which VGAM1276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45328] Nucleotide sequences of the VGAM1276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1276 are further described hereinbelow with reference to Table 1.

[45329] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1276 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45330] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1276 gene, herein designated VGAM is inhibition of expression of VGAM1276 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1276 correlate with, and may be deduced from, the identity of the target genes which VGAM1276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45331] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM_000028) is a VGAM1276 host target gene. AGL BINDING SITE1 through AGL BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING

SITE1 through AGL BINDING SITE6, designated SEQ ID:5465, SEQ ID:6282, SEQ ID:6287, SEQ ID:6292, SEQ ID:6297 and SEQ ID:6304 respectively, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45332] A function of VGAM1276 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM_000028). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL. Ankyrin 2, Neuronal (ANK2, Accession NM_020977) is another VGAM1276 host target gene. ANK2 BINDING SITE1 and ANK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE1 and ANK2 BINDING SITE2, designated SEQ ID:21965 and SEQ ID:13134 respectively, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45333] Another function of VGAM1276 is therefore inhibition of

Ankyrin 2, Neuronal (ANK2, Accession NM_020977), a gene which attaches integral membrane proteins to cytoskeletal elements. also binds to cytoskeletal proteins. Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2. The function of ANK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM769. Plastin 1 (I isoform) (PLS1, Accession NM_002670) is another VGAM1276 host target gene. PLS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS1 BINDING SITE, designated SEQ ID:8540, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45334] Another function of VGAM1276 is therefore inhibition of Plastin 1 (I isoform) (PLS1, Accession NM_002670). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PLS1. N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983) is another VGAM1276 host target gene. NAPG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NAPG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAPG BINDING SITE, designated SEQ ID:46250, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45335] Another function of VGAM1276 is therefore inhibition of N-ethylmaleimide-sensitive Factor Attachment Protein, Gamma (NAPG, Accession XM_172983). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAPG. PRO1992 (Accession NM_014107) is another VGAM1276 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992

BINDING SITE, designated SEQ ID:15335, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45336] Another function of VGAM1276 is therefore inhibition of PRO1992 (Accession NM_014107). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1992. LOC150606 (Accession XM_097928) is another VGAM1276 host target gene. LOC150606 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150606 BINDING SITE, designated SEQ ID:41234, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45337] Another function of VGAM1276 is therefore inhibition of LOC150606 (Accession XM_097928). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150606. LOC203286 (Accession XM_117526) is another VGAM1276 host target gene. LOC203286 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43496, to the nucleotide sequence of VGAM1276 RNA, herein designated VGAM RNA, also designated SEQ ID:3987.

[45338] Another function of VGAM1276 is therefore inhibition of LOC203286 (Accession XM_117526). Accordingly, utilities of VGAM1276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1277 (VGAM1277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45339] VGAM1277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1277 was detected is described hereinabove with reference to Figs. 1-8.

[45340] VGAM1277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C. VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45341] VGAM1277 gene encodes a VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1277 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1277 precursor RNA is designated SEQ ID:1263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1263 is located at position 156 relative to the genome of Human Enterovirus C.

[45342] VGAM1277 precursor RNA folds onto itself, forming VGAM1277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[45343] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1277 folded precursor RNA into VGAM1277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1277 RNA is designated SEQ ID:3988, and is provided hereinbelow with reference to the sequence listing part.

[45344] VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1277 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45345] VGAM1277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1277 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1277 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45346] The complementary binding of VGAM1277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1277 host target RNA into VGAM1277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45347] It is appreciated that VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1277 host target genes. The mRNA of each one of this plurality of VGAM1277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1277 RNA, herein designated VGAM RNA, and which when bound by VGAM1277 RNA causes inhibition of translation of respective one or more VGAM1277 host target proteins.

[45348] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1277 gene, herein designated VGAM GENE, on one or more VGAM1277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45349] It is yet further appreciated that a function of VGAM1277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM1277 correlate with, and may be deduced from, the identity of the host target genes which VGAM1277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45350] Nucleotide sequences of the VGAM1277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1277 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1277 are further described hereinbelow with reference to Table 1.

[45351] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1277 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1277 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45352] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1277 gene, herein designated VGAM is inhibition of expression of VGAM1277 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1277 correlate with, and may be deduced from, the identity of the target genes which VGAM1277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45353] Acid Phosphatase 1, Soluble (ACP1, Accession NM_007099) is a VGAM1277 host target gene. ACP1 BINDING SITE1 and ACP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE1 and ACP1 BINDING SITE2, designated SEQ ID:13957 and SEQ ID:10507 respectively, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45354] A function of VGAM1277 is therefore inhibition of Acid Phosphatase 1, Soluble (ACP1, Accession NM_007099), a gene which as demonstrated in starch-gel electrophoresis. Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP1. The function of ACP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Zinc Finger Protein 179 (ZNF179, Accession NM_007148) is another VGAM1277 host target gene. ZNF179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF179 BINDING SITE, designated SEQ ID:14000, to the nucleotide

sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45355] Another function of VGAM1277 is therefore inhibition of Zinc Finger Protein 179 (ZNF179, Accession NM_007148), a gene which has zinc finger and a member of the RING finger protein family of transcription factors. Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF179. The function of ZNF179 has been established by previous studies. Kimura et al. (1997) showed, by FISH analysis of metaphase or interphase chromosomes of 6 patients with Smith–Magenis syndrome (SMS; 182290), that ZNF179 was deleted in one of the homologs, indicating possible involvement of this gene in the pathogenesis of SMS. ZNF179 was sublocalized to a site proximal to LLGL (OMIM Ref. No. 600966), which is thought to be critical to SMS

[45356] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45357] Kimura, T.; Arakawa, Y.; Inoue, S.; Fukushima, Y.; Kondo, I.; Koyama, K.; Hosoi, T.; Orimo, A.; Muramatsu, M.; Nakamura, Y.; Abe, T.; Inazawa, J. : The brain finger protein

gene (ZNF179), a member of the RING finger family, maps within the Smith–Magenis syndrome region at 17p11.2.

Am. J. Med. Genet. 69: 320–324, 1997. ; and

[45358] Matsuda, Y.; Inue, S.; Seki, N.; Hosoi, T.; Orimo, A.; Muramatsu, M.; Hori, T. : Chromosome mapping of human (ZNF179), mouse, and rat genes for brain finger protein (bfp), a member of the R.

[45359] Further studies establishing the function and utilities of ZNF179 are found in John Hopkins OMIM database record ID 601237, and in cited publications numbered 2839–2840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14082 (Accession NM_025024) is another VGAM1277 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:24610, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45360] Another function of VGAM1277 is therefore inhibition of

FLJ14082 (Accession NM_025024). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. KIAA1130 (Accession XM_031104) is another VGAM1277 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31281, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45361] Another function of VGAM1277 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1536 (Accession NM_020898) is another VGAM1277 host target gene. KIAA1536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1536 BINDING SITE, designated SEQ ID:21925, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45362] Another function of VGAM1277 is therefore inhibition of KIAA1536 (Accession NM_020898). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1536. LOC121457 (Accession XM_058563) is another VGAM1277 host target gene. LOC121457 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121457 BINDING SITE, designated SEQ ID:36661, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45363] Another function of VGAM1277 is therefore inhibition of LOC121457 (Accession XM_058563). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121457. LOC146227 (Accession XM_085374) is an-

other VGAM1277 host target gene. LOC146227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146227 BINDING SITE, designated SEQ ID:38087, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45364] Another function of VGAM1277 is therefore inhibition of LOC146227 (Accession XM_085374). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146227. LOC256940 (Accession XM_172879) is another VGAM1277 host target gene. LOC256940 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256940 BINDING SITE, designated SEQ ID:46153, to the nucleotide sequence of VGAM1277 RNA, herein designated VGAM RNA, also designated SEQ ID:3988.

[45365] Another function of VGAM1277 is therefore inhibition of LOC256940 (Accession XM_172879). Accordingly, utilities of VGAM1277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256940. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1278 (VGAM1278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45366] VGAM1278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1278 was detected is described hereinabove with reference to Figs. 1–8.

[45367] VGAM1278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C. VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45368] VGAM1278 gene encodes a VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1278 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1278 precursor RNA is designated SEQ ID:1264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1264 is located at position 1945 relative to the genome of Human Enterovirus C.

[45369] VGAM1278 precursor RNA folds onto itself, forming VGAM1278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45370] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1278 folded precursor RNA into VGAM1278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1278 RNA is designated SEQ ID:3989, and is provided hereinbelow with reference to the sequence listing part.

[45371] VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1278 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[45372] VGAM1278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1278 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45373] The complementary binding of VGAM1278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1278 host target RNA into VGAM1278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45374] It is appreciated that VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1278 host target genes. The mRNA of each one of this plurality of VGAM1278 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1278 RNA, herein designated VGAM RNA, and which when bound by VGAM1278 RNA causes inhibition of translation of respective one or more VGAM1278 host target proteins.

[45375] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1278 gene, herein designated VGAM GENE, on one or more VGAM1278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45376] It is yet further appreciated that a function of VGAM1278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1278 include diagnosis, prevention and treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM1278 correlate with, and may be deduced from, the identity of the host target genes which VGAM1278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45377] Nucleotide sequences of the VGAM1278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1278 are further described hereinbelow with reference to Table 1.

[45378] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1278 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1278 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[45379] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1278 gene, herein designated VGAM is inhibition of expression of VGAM1278 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1278 correlate with, and may be deduced from, the identity of the target genes which VGAM1278 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45380] Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is a VGAM1278 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6952, to the nucleotide sequence of VGAM1278 RNA, herein designated VGAM RNA, also designated SEQ ID:3989.

[45381] A function of VGAM1278 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282), a gene which links clathrin to re-

ceptors in coated vesicles. Accordingly, utilities of VGAM1278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755) is another VGAM1278 host target gene. CBFB BINDING SITE1 and CBFB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFB BINDING SITE1 and CBFB BINDING SITE2, designated SEQ ID:7506 and SEQ ID:23147 respectively, to the nucleotide sequence of VGAM1278 RNA, herein designated VGAM RNA, also designated SEQ ID:3989.

[45382] Another function of VGAM1278 is therefore inhibition of Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755), a gene which is beta subunit of the transcription factor CBF which causes leukemia. Accordingly, utilities of VGAM1278 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CBFB. The function of CBFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.MBLL39 (Accession NM_144778) is another VGAM1278 host target gene. MBLL39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBLL39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBLL39 BINDING SITE, designated SEQ ID:29573, to the nucleotide sequence of VGAM1278 RNA, herein designated VGAM RNA, also designated SEQ ID:3989.

[45383] Another function of VGAM1278 is therefore inhibition of MBLL39 (Accession NM_144778). Accordingly, utilities of VGAM1278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBLL39. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1279 (VGAM1279) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[45384] VGAM1279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1279 was detected is described hereinabove with reference to Figs. 1–8.

[45385] VGAM1279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C. VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45386] VGAM1279 gene encodes a VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1279 precursor RNA is designated SEQ ID:1265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1265 is located at position 1075 relative to the genome of Human Enterovirus C.

[45387] VGAM1279 precursor RNA folds onto itself, forming VGAM1279 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45388] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1279 folded precursor RNA into VGAM1279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1279 RNA is designated SEQ ID:3990, and is provided hereinbelow with reference to the sequence listing part.

[45389] VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1279 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45390] VGAM1279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1279 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45391] The complementary binding of VGAM1279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1279 host target RNA into VGAM1279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45392] It is appreciated that VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1279 host target genes. The mRNA of each one of this plurality of VGAM1279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1279 RNA, herein designated VGAM RNA, and which when bound by VGAM1279 RNA causes inhibition of translation of respective one or more VGAM1279 host target proteins.

[45393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1279 gene, herein designated VGAM GENE, on one or more VGAM1279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45394] It is yet further appreciated that a function of VGAM1279 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM1279 correlate with, and may be deduced from, the identity of the host target genes which VGAM1279 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[45395] Nucleotide sequences of the VGAM1279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1279 are further described hereinbelow with reference to Table 1.

[45396] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1279 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45397] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1279 gene, herein designated VGAM is inhibition of expression of VGAM1279 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1279 correlate with, and may be deduced from, the identity of the target genes which VGAM1279 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45398] Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is a VGAM1279 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:18996, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45399] A function of VGAM1279 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. FLJ12960 (Accession NM_024638) is another VGAM1279 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated

SEQ ID:23913, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45400] Another function of VGAM1279 is therefore inhibition of FLJ12960 (Accession NM_024638). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. G Protein Pathway Suppressor 2 (GPS2, Accession NM_004489) is another VGAM1279 host target gene. GPS2 BINDING SITE1 and GPS2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GPS2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPS2 BINDING SITE1 and GPS2 BINDING SITE2, designated SEQ ID:10824 and SEQ ID:42146 respectively, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45401] Another function of VGAM1279 is therefore inhibition of G Protein Pathway Suppressor 2 (GPS2, Accession NM_004489). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with GPS2. LOC126430 (Accession XM_065082) is another VGAM1279 host target gene. LOC126430 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126430 BINDING SITE, designated SEQ ID:37276, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45402] Another function of VGAM1279 is therefore inhibition of LOC126430 (Accession XM_065082). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126430. LOC144501 (Accession XM_096612) is another VGAM1279 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:40428, to

the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45403] Another function of VGAM1279 is therefore inhibition of LOC144501 (Accession XM_096612). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC148398 (Accession XM_086174) is another VGAM1279 host target gene. LOC148398 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148398 BINDING SITE, designated SEQ ID:38530, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45404] Another function of VGAM1279 is therefore inhibition of LOC148398 (Accession XM_086174). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148398. LOC167153 (Accession XM_094312) is another VGAM1279 host target gene. LOC167153 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC167153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC167153 BINDING SITE, designated SEQ ID:40230, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45405] Another function of VGAM1279 is therefore inhibition of LOC167153 (Accession XM_094312). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167153. LOC199221 (Accession XM_087310) is another VGAM1279 host target gene. LOC199221 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199221 BINDING SITE, designated SEQ ID:39163, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45406] Another function of VGAM1279 is therefore inhibition of LOC199221 (Accession XM_087310). Accordingly, utilities

of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199221. LOC201911 (Accession XM_117339) is another VGAM1279 host target gene. LOC201911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201911 BINDING SITE, designated SEQ ID:43389, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45407] Another function of VGAM1279 is therefore inhibition of LOC201911 (Accession XM_117339). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201911. LOC220565 (Accession XM_165417) is another VGAM1279 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220565 BINDING SITE, designated SEQ ID:43632, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45408] Another function of VGAM1279 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC254228 (Accession XM_171123) is another VGAM1279 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45917, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45409] Another function of VGAM1279 is therefore inhibition of LOC254228 (Accession XM_171123). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. LOC256310 (Accession XM_172813) is another VGAM1279 host target gene. LOC256310 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:46094, to the nucleotide sequence of VGAM1279 RNA, herein designated VGAM RNA, also designated SEQ ID:3990.

[45410] Another function of VGAM1279 is therefore inhibition of LOC256310 (Accession XM_172813). Accordingly, utilities of VGAM1279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1280 (VGAM1280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45411] VGAM1280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1280 was detected is described hereinabove with reference to Figs. 1-8.

[45412] VGAM1280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C. VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45413] VGAM1280 gene encodes a VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1280 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1280 precursor RNA is designated SEQ ID:1266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1266 is located at position 1669 relative to the genome of Human Enterovirus C.

[45414] VGAM1280 precursor RNA folds onto itself, forming VGAM1280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[45415] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1280 folded precursor RNA into VGAM1280 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1280 RNA is designated SEQ ID:3991, and is provided hereinbelow with reference to the sequence listing part.

[45416] VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1280 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45417] VGAM1280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1280 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1280 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45418] The complementary binding of VGAM1280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1280 host target RNA into VGAM1280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45419] It is appreciated that VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1280 host target genes. The mRNA of each one of this plurality of VGAM1280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1280 RNA, herein designated VGAM RNA, and which when bound by VGAM1280 RNA causes inhibition of translation of respective one or more VGAM1280 host target proteins.

[45420] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1280 gene, herein designated VGAM GENE, on one or more VGAM1280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45421] It is yet further appreciated that a function of VGAM1280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM1280 correlate with, and may be deduced from, the identity of the host target genes which VGAM1280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45422] Nucleotide sequences of the VGAM1280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1280 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1280 are further described hereinbelow with reference to Table 1.

[45423] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1280 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45424] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1280 gene, herein designated VGAM is inhibition of expression of VGAM1280 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1280 correlate with, and may be deduced from, the identity of the target genes which VGAM1280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45425] Activin A Receptor, Type I (ACVR1, Accession NM_001105) is a VGAM1280 host target gene. ACVR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ACVR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ACVR1 BINDING SITE, designated SEQ ID:6763, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45426] A function of VGAM1280 is therefore inhibition of Activin A Receptor, Type I (ACVR1, Accession NM_001105), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1. The function of ACVR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217.AF3P21 (Accession NM_016453) is another VGAM1280 host target gene. AF3P21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AF3P21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF3P21 BINDING SITE, designated SEQ ID:18568, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ

ID:3991.

[45427] Another function of VGAM1280 is therefore inhibition of AF3P21 (Accession NM_016453), a gene which has an important role in stress fiber formation induced by active diaphanous protein homolog 1 (drf1). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF3P21. The function of AF3P21 has been established by previous studies. Sano et al. (2000) identified the AF3p21 gene as a novel fusion partner of the MLL gene (OMIM Ref. No. 159555) in a 23-year-old patient who developed therapy-related leukemia (AML, FAB M5b) with t(3;11)(p21;q23). Hayakawa et al. (2001) further characterized the AF3p21 gene. AF3p21 encodes a nuclear protein consisting of 722 amino acids with an SH3 domain, a proline-rich domain, and a bipartite nuclear localization signal. The protein's SH3 domain has high homology with that of FYN (OMIM Ref. No. 137025). Hayakawa et al. (2001) found that in DNA from the patient's leukemic cells, intron 6 of the MLL gene was fused at a point upstream of exon 1 in the AF3p21 gene, and that the der(11) chromosome formed an MLL-AF3p21 fusion transcript in leukemic cells, whereas the der(3) chromosome did not

form any fusion transcript. Dot blot RNA analysis showed that the AF3p21 gene was expressed in all adult and embryonic human tissues examined, including bone marrow, brain, liver, thymus, lung, and skeletal muscle. Northern blot analysis of HeLa cell RNA detected a 3.5-kb transcript. The protein has an apparent molecular weight of 80 kD and is localized exclusively in the cell nucleus. These results suggested that AF3p21 protein plays a role in signal transduction in the nucleus. Hayakawa et al. (2001) determined that the AF3p21 gene on 3p21 is 19 kb long and consists of 13 exons.

[45428] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45429] Hayakawa, A.; Matsuda, Y.; Daibata, M.; Nakamura, H.; Sano, K. : Genomic organization, tissue expression, and cellular localization of AF3p21, a fusion partner of MLL in therapy-related leukemia. *Genes Chromosomes Cancer* 30: 364–374, 2001. ; and

[45430] Sano, K.; Hayakawa, A.; Piao, J.-H.; Kosaka, Y.; Nakamura, H. : Novel SH3 protein encoded by the AF3p21 gene is fused to the mixed lineage leukemia protein in a therapy-related leukemia.

[45431] Further studies establishing the function and utilities of AF3P21 are found in John Hopkins OMIM database record ID 606671, and in cited publications numbered 6457–6458 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Frizzled Homolog 6 (Drosophila) (FZD6, Accession NM_003506) is another VGAM1280 host target gene. FZD6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD6 BINDING SITE, designated SEQ ID:9596, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45432] Another function of VGAM1280 is therefore inhibition of Frizzled Homolog 6 (Drosophila) (FZD6, Accession NM_003506). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD6. Growth Arrest-specific 11 (GAS11, Accession NM_001481) is another VGAM1280 host target gene. GAS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by GAS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS11 BINDING SITE, designated SEQ ID:7223, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45433] Another function of VGAM1280 is therefore inhibition of Growth Arrest-specific 11 (GAS11, Accession NM_001481). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS11. Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834) is another VGAM1280 host target gene. GRIN2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2B BINDING SITE, designated SEQ ID:6490, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45434] Another function of VGAM1280 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN2B. BH-protocadherin (brain-heart) (PCDH7, Accession NM_002589) is another VGAM1280 host target gene. PCDH7 BINDING SITE1 through PCDH7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH7 BINDING SITE1 through PCDH7 BINDING SITE3, designated SEQ ID:8451, SEQ ID:26215 and SEQ ID:26219 respectively, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45435] Another function of VGAM1280 is therefore inhibition of BH-protocadherin (brain-heart) (PCDH7, Accession NM_002589). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7. Ret Proto-oncogene (multiple endocrine neoplasia and medullary

thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020975) is another VGAM1280 host target gene. RET BINDING SITE1 and RET BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RET, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE1 and RET BINDING SITE2, designated SEQ ID:21961 and SEQ ID:17508 respectively, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45436] Another function of VGAM1280 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020975), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.SH3-domain Binding Protein 4 (SH3BP4,

Accession NM_014521) is another VGAM1280 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:15855, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45437] Another function of VGAM1280 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM_004872) is another VGAM1280 host target gene. C1orf8 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by C1orf8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf8 BINDING SITE, designated SEQ ID:11299, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45438] Another function of VGAM1280 is therefore inhibition of Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM_004872). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf8. Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248) is another VGAM1280 host target gene. CTNNBIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CTNNBIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNBIP1 BINDING SITE, designated SEQ ID:21546, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45439] Another function of VGAM1280 is therefore inhibition of Catenin, Beta Interacting Protein 1 (CTNNBIP1, Accession NM_020248). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNBIP1. DKFZP434E2135 (Accession NM_030804) is another VGAM1280 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25117, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45440] Another function of VGAM1280 is therefore inhibition of DKFZP434E2135 (Accession NM_030804). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. DKFZp761N0624 (Accession NM_032295) is another VGAM1280 host target gene. DKFZp761N0624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZp761N0624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N0624 BINDING SITE, designated SEQ ID:26072, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45441] Another function of VGAM1280 is therefore inhibition of DKFZp761N0624 (Accession NM_032295). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N0624. DKFZp762E1312 (Accession NM_018410) is another VGAM1280 host target gene. DKFZp762E1312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:20452, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45442] Another function of VGAM1280 is therefore inhibition of

DKFZp762E1312 (Accession NM_018410). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1312. F-box Only Protein 24 (FBXO24, Accession NM_012172) is another VGAM1280 host target gene. FBXO24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO24 BINDING SITE, designated SEQ ID:14465, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45443] Another function of VGAM1280 is therefore inhibition of F-box Only Protein 24 (FBXO24, Accession NM_012172). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO24. FLJ20651 (Accession NM_017919) is another VGAM1280 host target gene. FLJ20651 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20651, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20651 BINDING SITE, designated SEQ ID:19576, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45444] Another function of VGAM1280 is therefore inhibition of FLJ20651 (Accession NM_017919). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20651. FLJ21168 (Accession NM_025073) is another VGAM1280 host target gene. FLJ21168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:24672, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45445] Another function of VGAM1280 is therefore inhibition of FLJ21168 (Accession NM_025073). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ21168. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM1280 host target gene. GGA2 BINDING SITE1 and GGA2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE1 and GGA2 BINDING SITE2, designated SEQ ID:28923 and SEQ ID:17402 respectively, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45446] Another function of VGAM1280 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA1550 (Accession XM_039393) is another VGAM1280 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33074, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45447] Another function of VGAM1280 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. KIAA1729 (Accession XM_114418) is another VGAM1280 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42951, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45448] Another function of VGAM1280 is therefore inhibition of KIAA1729 (Accession XM_114418). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1729. MGC4663 (Accession NM_024514) is another VGAM1280 host target gene. MGC4663 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC4663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4663 BINDING SITE, designated SEQ ID:23717, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45449] Another function of VGAM1280 is therefore inhibition of MGC4663 (Accession NM_024514). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4663. RIS1 (Accession XM_087461) is another VGAM1280 host target gene. RIS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RIS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RIS1 BINDING SITE, designated SEQ ID:39273, to the nucleotide sequence of

VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45450] Another function of VGAM1280 is therefore inhibition of RIS1 (Accession XM_087461). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RIS1. Zinc Finger Protein 220 (ZNF220, Accession NM_006766) is another VGAM1280 host target gene. ZNF220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF220 BINDING SITE, designated SEQ ID:13632, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45451] Another function of VGAM1280 is therefore inhibition of Zinc Finger Protein 220 (ZNF220, Accession NM_006766). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF220. LOC116064 (Accession XM_057296) is another VGAM1280 host target gene. LOC116064 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC116064, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116064 BINDING SITE, designated SEQ ID:36497, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45452] Another function of VGAM1280 is therefore inhibition of LOC116064 (Accession XM_057296). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116064. LOC158293 (Accession XM_088541) is another VGAM1280 host target gene. LOC158293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158293 BINDING SITE, designated SEQ ID:39805, to the nucleotide sequence of VGAM1280 RNA, herein designated VGAM RNA, also designated SEQ ID:3991.

[45453] Another function of VGAM1280 is therefore inhibition of

LOC158293 (Accession XM_088541). Accordingly, utilities of VGAM1280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158293. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1281 (VGAM1281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45454] VGAM1281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1281 was detected is described hereinabove with reference to Figs. 1-8.

[45455] VGAM1281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Virus Q. VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45456] VGAM1281 gene encodes a VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1281 precursor RNA is designated SEQ ID:1267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1267 is located at position 1984 relative to the genome of Beet Virus Q.

- [45457] VGAM1281 precursor RNA folds onto itself, forming VGAM1281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45458] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1281 folded precursor RNA into VGAM1281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1281 RNA is designated SEQ ID:3992, and

is provided hereinbelow with reference to the sequence listing part.

[45459] VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1281 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[45460] VGAM1281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1281 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1281 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45461] The complementary binding of VGAM1281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1281 host target RNA into VGAM1281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45462] It is appreciated that VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1281 host target genes. The mRNA of each one of this plurality of VGAM1281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1281 RNA, herein designated VGAM RNA, and which when bound by VGAM1281 RNA causes inhibition of translation of respective one or more VGAM1281 host target proteins.

[45463] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1281 gene, herein designated VGAM GENE, on one or more VGAM1281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45464] It is yet further appreciated that a function of VGAM1281 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of viral infection by Beet Virus Q. Specific functions, and accordingly utilities, of VGAM1281 correlate with, and may be deduced from, the identity of the host target genes which VGAM1281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45465] Nucleotide sequences of the VGAM1281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1281 are further described hereinbelow with reference to Table 1.

[45466] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1281 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45467] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1281 gene, herein designated VGAM is inhibition of expression of VGAM1281 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1281 correlate with, and may be deduced from, the identity of the target genes which VGAM1281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45468] LFG (Accession XM_084780) is a VGAM1281 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37698, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45469] A function of VGAM1281 is therefore inhibition of LFG (Accession XM_084780). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is another VGAM1281 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in

the 5` untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:44843, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45470] Another function of VGAM1281 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is another VGAM1281 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6049, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45471] Another function of VGAM1281 is therefore inhibition of

Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class II MHC promoters. Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Sorting Nexin 6 (SNX6, Accession NM_021249) is another VGAM1281 host target gene. SNX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX6 BINDING SITE, designated SEQ ID:22218, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45472] Another function of VGAM1281 is therefore inhibition of Sorting Nexin 6 (SNX6, Accession NM_021249). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX6. TAR (HIV) RNA Binding Protein 2 (TARBP2,

Accession NM_134324) is another VGAM1281 host target gene. TARBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TARBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TARBP2 BINDING SITE, designated SEQ ID:28630, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45473] Another function of VGAM1281 is therefore inhibition of TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM_134324), a gene which is involved in the regulation of HIV replication. Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARBP2. The function of TARBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Thiopurine S-methyltransferase (TPMT, Accession NM_000367) is another VGAM1281 host target gene. TPMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TPMT,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPMT BINDING SITE, designated SEQ ID:5937, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45474] Another function of VGAM1281 is therefore inhibition of Thiopurine S-methyltransferase (TPMT, Accession NM_000367), a gene which catalyzes the s-methylation of thiopurine drugs such as 6-mercaptopurine. Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPMT. The function of TPMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM682. Amino adipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM_015423) is another VGAM1281 host target gene. AASDHPPT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AASDHPPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of AASDHPPT BINDING SITE, designated SEQ ID:17723, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45475] Another function of VGAM1281 is therefore inhibition of Amino adipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM_015423). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AASDHPPT. UDP-Gal:betaGal Beta 1,3-galactosyltransferase Polypeptide 6 (B3GALT6, Accession NM_080605) is another VGAM1281 host target gene. B3GALT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT6 BINDING SITE, designated SEQ ID:27923, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45476] Another function of VGAM1281 is therefore inhibition of UDP-Gal:betaGal Beta 1,3-galactosyltransferase Polypep-

tide 6 (B3GALT6, Accession NM_080605). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT6. Death-associated Protein Kinase 2 (DA PK2, Accession NM_014326) is another VGAM1281 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15632, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45477] Another function of VGAM1281 is therefore inhibition of Death-associated Protein Kinase 2 (DA PK2, Accession NM_014326). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. DKFZP761F241 (Accession NM_031455) is another VGAM1281 host target gene. DKFZP761F241 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP761F241, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761F241 BINDING SITE, designated SEQ ID:25475, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45478] Another function of VGAM1281 is therefore inhibition of DKFZP761F241 (Accession NM_031455). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761F241. Enabled Homolog (Drosophila) (ENAH, Accession NM_018212) is another VGAM1281 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20122, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45479] Another function of VGAM1281 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession

NM_018212). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. FLJ30574 (Accession NM_144629) is another VGAM1281 host target gene.

FLJ30574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30574 BINDING SITE, designated SEQ ID:29446, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45480] Another function of VGAM1281 is therefore inhibition of FLJ30574 (Accession NM_144629). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30574. Oxysterol Binding Protein-like 10 (OSBPL10, Accession NM_017784) is another VGAM1281 host target gene. OSBPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL10 BINDING SITE, designated SEQ ID:19416, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45481] Another function of VGAM1281 is therefore inhibition of Oxysterol Binding Protein-like 10 (OSBPL10, Accession NM_017784). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL10. ZF (Accession NM_021212) is another VGAM1281 host target gene. ZF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF BINDING SITE, designated SEQ ID:22190, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45482] Another function of VGAM1281 is therefore inhibition of ZF (Accession NM_021212). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF.

LOC116068 (Accession XM_057302) is another VGAM1281 host target gene. LOC116068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116068 BINDING SITE, designated SEQ ID:36501, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45483] Another function of VGAM1281 is therefore inhibition of LOC116068 (Accession XM_057302). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116068. LOC151121 (Accession XM_087102) is another VGAM1281 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39052, to the nucleotide sequence of VGAM1281 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3992.

[45484] Another function of VGAM1281 is therefore inhibition of LOC151121 (Accession XM_087102). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC201411 (Accession XM_031946) is another VGAM1281 host target gene. LOC201411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201411 BINDING SITE, designated SEQ ID:31526, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45485] Another function of VGAM1281 is therefore inhibition of LOC201411 (Accession XM_031946). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201411. LOC254085 (Accession XM_171189) is another VGAM1281 host target gene. LOC254085 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254085, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254085 BINDING SITE, designated SEQ ID:45972, to the nucleotide sequence of VGAM1281 RNA, herein designated VGAM RNA, also designated SEQ ID:3992.

[45486] Another function of VGAM1281 is therefore inhibition of LOC254085 (Accession XM_171189). Accordingly, utilities of VGAM1281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254085. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1282 (VGAM1282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45487] VGAM1282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1282 was detected is described hereinabove with reference to Figs. 1-8.

[45488] VGAM1282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Virus Q. VGAM1282

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45489] VGAM1282 gene encodes a VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1282 precursor RNA is designated SEQ ID:1268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1268 is located at position 3568 relative to the genome of Beet Virus Q.

[45490] VGAM1282 precursor RNA folds onto itself, forming VGAM1282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1282 folded precursor RNA into VGAM1282

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1282 RNA is designated SEQ ID:3993, and is provided hereinbelow with reference to the sequence listing part.

[45492] VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1282 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45493] VGAM1282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1282 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45494] The complementary binding of VGAM1282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1282 host target RNA into VGAM1282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[45495] It is appreciated that VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1282 host target genes. The mRNA of each one of this plurality of VGAM1282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1282 RNA, herein designated VGAM RNA, and which when bound by VGAM1282 RNA causes inhibition of translation of respective one or more VGAM1282 host target proteins.

[45496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1282 gene, herein designated VGAM GENE, on one or more VGAM1282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45497] It is yet further appreciated that a function of VGAM1282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of viral infection by Beet Virus Q. Specific functions, and accordingly utilities, of VGAM1282 correlate with, and may be deduced from, the identity of the host target genes which VGAM1282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45498] Nucleotide sequences of the VGAM1282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1282 are further described hereinbelow with reference to Table 1.

[45499] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1282 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1282 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1282 gene, herein designated VGAM is inhibition of expression of VGAM1282 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1282 correlate with, and may be deduced from, the identity of the target genes which VGAM1282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45501] FLJ10726 (Accession NM_018195) is a VGAM1282 host target gene. FLJ10726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10726 BINDING SITE, designated SEQ ID:20058, to the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3993.

[45502] A function of VGAM1282 is therefore inhibition of FLJ10726 (Accession NM_018195). Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10726. FLJ23153 (Accession NM_024636) is another VGAM1282 host target gene. FLJ23153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23153 BINDING SITE, designated SEQ ID:23908, to the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, also designated SEQ ID:3993.

[45503] Another function of VGAM1282 is therefore inhibition of FLJ23153 (Accession NM_024636). Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23153. KIAA1036 (Accession NM_014909) is another VGAM1282 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17127, to the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, also designated SEQ ID:3993.

[45504] Another function of VGAM1282 is therefore inhibition of KIAA1036 (Accession NM_014909). Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1577 (Accession XM_035299) is another VGAM1282 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:32212, to the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, also designated SEQ ID:3993.

[45505] Another function of VGAM1282 is therefore inhibition of KIAA1577 (Accession XM_035299). Accordingly, utilities of VGAM1282 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1577. LOC91308 (Accession XM_037600) is another VGAM1282 host target gene. LOC91308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91308 BINDING SITE, designated SEQ ID:32657, to the nucleotide sequence of VGAM1282 RNA, herein designated VGAM RNA, also designated SEQ ID:3993.

[45506] Another function of VGAM1282 is therefore inhibition of LOC91308 (Accession XM_037600). Accordingly, utilities of VGAM1282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1283 (VGAM1283) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45507] VGAM1283 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1283 was detected is described hereinabove with reference to Figs. 1–8.

[45508] VGAM1283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Virus Q. VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45509] VGAM1283 gene encodes a VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1283 precursor RNA is designated SEQ ID:1269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1269 is located at position 3671 relative to the genome of Beet Virus Q.

[45510] VGAM1283 precursor RNA folds onto itself, forming VGAM1283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45511] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1283 folded precursor RNA into VGAM1283 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1283 RNA is designated SEQ ID:3994, and is provided hereinbelow with reference to the sequence listing part.

[45512] VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1283 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45513] VGAM1283 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1283 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45514] The complementary binding of VGAM1283 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1283 host target RNA into VGAM1283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45515] It is appreciated that VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1283 host target genes. The mRNA of each one of this plurality of VGAM1283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1283 RNA, herein designated VGAM RNA, and which when bound by VGAM1283 RNA causes inhibition of translation of respective one or more VGAM1283 host target proteins.

[45516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1283 gene, herein designated VGAM GENE, on one or more VGAM1283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45517] It is yet further appreciated that a function of VGAM1283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of viral infection by Beet Virus Q. Specific functions, and accordingly utilities, of VGAM1283 correlate with, and may be deduced from, the identity of the host target genes which VGAM1283 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45518] Nucleotide sequences of the VGAM1283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1283 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1283 are further described hereinbelow with reference to Table 1.

[45519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1283 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45520] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1283 gene, herein designated VGAM is inhibition of expression of VGAM1283 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1283 correlate with, and may be deduced from, the identity of the target genes which VGAM1283 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45521] S-adenosylhomocysteine Hydrolase (AHCY, Accession NM_000687) is a VGAM1283 host target gene. AHCY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHCY, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHCY BINDING SITE, designated SEQ ID:6344, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45522] A function of VGAM1283 is therefore inhibition of S-adenosylhomocysteine Hydrolase (AHCY, Accession NM_000687). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHCY. Archain 1 (ARCN1, Accession NM_001655) is another VGAM1283 host target gene. ARCN1 BINDING SITE1 and ARCN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARCN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARCN1 BINDING SITE1 and ARCN1 BINDING SITE2, designated SEQ ID:7367 and SEQ ID:7369 respectively, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45523] Another function of VGAM1283 is therefore inhibition of

Archain 1 (ARCN1, Accession NM_001655), a gene which plays a fundamental role in eukaryotic cell biology. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARCN1. The function of ARCN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1226. Cell Division Cycle 42 (GTP binding protein, 25kDa) (CDC42, Accession NM_001791) is another VGAM1283 host target gene. CDC42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42 BINDING SITE, designated SEQ ID:7542, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45524] Another function of VGAM1283 is therefore inhibition of Cell Division Cycle 42 (GTP binding protein, 25kDa) (CDC42, Accession NM_001791). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CDC42. Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360) is another VGAM1283 host target gene. CDH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH1 BINDING SITE, designated SEQ ID:10566, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45525] Another function of VGAM1283 is therefore inhibition of Cadherin 1, Type 1, E-cadherin (epithelial) (CDH1, Accession NM_004360). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH1. Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM_003936) is another VGAM1283 host target gene. CDK5R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK5R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CDK5R2 BINDING SITE, designated SEQ ID:10043, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45526] Another function of VGAM1283 is therefore inhibition of Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM_003936), a gene which acts as a regulatory subunit for the cyclin-dependent CDK5. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5R2. The function of CDK5R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM403. Dedicator of Cyto-kinesis 1 (DOCK1, Accession NM_001380) is another VGAM1283 host target gene. DOCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK1 BINDING SITE, designated SEQ ID:7052, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA,

also designated SEQ ID:3994.

[45527] Another function of VGAM1283 is therefore inhibition of Dedicator of Cyto-kinesis 1 (DOCK1, Accession NM_001380), a gene which may function in the extension of cell surfaces. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK1. The function of DOCK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM564. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_138619) is another VGAM1283 host target gene. GGA3 BINDING SITE1 and GGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA3 BINDING SITE1 and GGA3 BINDING SITE2, designated SEQ ID:28902 and SEQ ID:15199 respectively, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45528] Another function of VGAM1283 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_138619), a gene which may play a role in the regulation of membrane traffic through the trans-golgi network. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA3. The function of GGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM353. Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM_052962) is another VGAM1283 host target gene. IL22RA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL22RA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22RA2 BINDING SITE, designated SEQ ID:27524, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45529] Another function of VGAM1283 is therefore inhibition of Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession

NM_052962), a gene which induces the production of acute-phase reactants. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22RA2. The function of IL22RA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281) is another VGAM1283 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14612, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45530] Another function of VGAM1283 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM1283 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM449.Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450) is another VGAM1283 host target gene.

KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42268, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45531] Another function of VGAM1283 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL3. LIM Domain Only 1 (rhombotin 1) (LMO1, Accession NM_002315) is another VGAM1283 host target gene. LMO1 BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by LMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO1 BINDING SITE, designated SEQ ID:8128, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45532] Another function of VGAM1283 is therefore inhibition of LIM Domain Only 1 (rhombotin 1) (LMO1, Accession NM_002315). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO1. Lysyl Oxidase-like 2 (LOXL2, Accession NM_002318) is another VGAM1283 host target gene. LOXL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOXL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL2 BINDING SITE, designated SEQ ID:8132, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45533] Another function of VGAM1283 is therefore inhibition of Lysyl Oxidase-like 2 (LOXL2, Accession NM_002318), a gene which may have roles in senescence and cell adhesion. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOXL2. The function of LOXL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM147. Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269) is another VGAM1283 host target gene. NR2E1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR2E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2E1 BINDING SITE, designated SEQ ID:9280, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45534] Another function of VGAM1283 is therefore inhibition of Nuclear Receptor Subfamily 2, Group E, Member 1 (NR2E1, Accession NM_003269), a gene which may be required for brain development and be involved in the regulation of

retinal development . Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2E1. The function of NR2E1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM689. Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 duncce homolog, Drosophila) (PDE4A, Accession NM_006202) is another VGAM1283 host target gene. PDE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4A BINDING SITE, designated SEQ ID:12877, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45535] Another function of VGAM1283 is therefore inhibition of Phosphodiesterase 4A, CAMP-specific (phosphodiesterase E2 duncce homolog, Drosophila) (PDE4A, Accession NM_006202), a gene which is a CAMP-specific phosphodiesterase . Accordingly, utilities of VGAM1283 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4A. The function of PDE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1214. Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608) is another VGAM1283 host target gene. PDGFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFB BINDING SITE, designated SEQ ID:8471, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45536] Another function of VGAM1283 is therefore inhibition of Platelet-derived Growth Factor Beta Polypeptide (simian sarcoma viral (v-sis) Oncogene Homolog) (PDGFB, Accession NM_002608), a gene which plays an important role in stimulating adjacent cells to grow and thereby heal the wound. Accordingly, utilities of VGAM1283 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with PDGFB. The function of PDGFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM_006245) is another VGAM1283 host target gene. PPP2R5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5D BINDING SITE, designated SEQ ID:12916, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45537] Another function of VGAM1283 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM_006245), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5D. The function of PPP2R5D and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM96. Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944) is another VGAM1283 host target gene. PPP3CA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP3CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP3CA BINDING SITE, designated SEQ ID:6647, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45538] Another function of VGAM1283 is therefore inhibition of Protein Phosphatase 3 (formerly 2B), Catalytic Subunit, Alpha Isoform (calcineurin A alpha) (PPP3CA, Accession NM_000944), a gene which is the catalytic subunit of calcium-dependent, calmodulin-stimulated protein phosphatase. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP3CA. The function of PPP3CA and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Periaxin (PRX, Accession NM_020956) is another VGAM1283 host target gene. PRX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRX BINDING SITE, designated SEQ ID:21939, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45539] Another function of VGAM1283 is therefore inhibition of Periaxin (PRX, Accession NM_020956), a gene which seems to be required for maintenance of peripheral nerve myelin sheath. may have a role in axon-glial interactions, possibly by interacting with the cytoplasmic domains of integral membrane proteins such as myelin-associated glycoprotein in the periaxonal regions of the schwann cell plasma membrane. may have a role in the early phases of myelin deposition. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRX. The function of

PRX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM476. Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314) is another VGAM1283 host target gene. PTEN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:5852, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45540] Another function of VGAM1283 is therefore inhibition of Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM_000314). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN. Paxillin (PXN, Accession NM_002859) is another VGAM1283 host target gene. PXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXN, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:8758, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45541] Another function of VGAM1283 is therefore inhibition of Paxillin (PXN, Accession NM_002859), a gene which may be involved in p53-dependent apoptosis. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXN. The function of PXN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM132. Retinal G Protein Coupled Receptor (RGR, Accession NM_002921) is another VGAM1283 host target gene. RGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGR BINDING SITE, designated SEQ ID:8826, to the nucleotide sequence of VGAM1283 RNA, herein

designated VGAM RNA, also designated SEQ ID:3994.

[45542] Another function of VGAM1283 is therefore inhibition of Retinal G Protein Coupled Receptor (RGR, Accession NM_002921), a gene which catalyse the isomerization of the chromophore by a retinochrome-like mechanism and act as a receptor for all-trans-and 11-cis-retinal. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGR. The function of RGR has been established by previous studies. Jiang et al. (1993) identified an opsin-related gene that is preferentially expressed at high levels in the RPE and Muller cells of the neural retina. The gene encodes a putative RPE-retinal G protein-coupled receptor (RGR) with 7 transmembrane segments. The putative receptor most closely resembled the subfamily of visual pigments and retinochromes. Shen et al. (1994) found that the amino acid sequence of RGR in humans is 86% identical to that of bovine RGR and that a lysine residue, analogous to the retinaldehyde attachment site of rhodopsin (OMIM Ref. No. 180380), is conserved in the seventh transmembrane domain of RGR in both species. The human gene spans 14.8 kb and is split into 7 exons. The structure of the gene is distinct from that of the visual

pigment genes. Shen et al. (1994) suggested that the RGR gene represents the earliest independent branch of the vertebrate opsin gene family. A second form of human RGR in retina was predicted by alternative splicing of its precursor mRNA. This RGR variant resulted from the alternative use of an internal acceptor splice site in the second intron of the human gene, and it contained an insertion of 4 amino acids in the connecting loop between the second and third transmembrane domains. Morimura et al. (1999) reported 2 mutations in RGR in patients with photoreceptor degeneration, indicating that RGR is essential to the retina. Using a single-strand conformation technique, Morimura et al. (1999) searched for mutations in the exons and flanking intron sequences of RGR in 182 unrelated patients with dominantly inherited retinitis pigmentosa, 182 with recessive retinitis pigmentosa, 383 with simplex retinitis pigmentosa (sporadic cases), 45 with Leber congenital amaurosis, 28 with retinitis punctata albescens, 22 with choroidal sclerosis, and 93–95 normal controls. One index patient with recessive RP was homozygous for a ser66-to-arg missense mutation (600342.0001). A second patient, originally diagnosed with choroidal sclerosis, was heterozygous for a 1-bp in-

sertion in codon gly275 (GGA-to-GGGA) near the 3-prime end of the coding region (600342.0002). Both affected sibs were heterozygotes and an unaffected sib was homozygous wildtype. The deceased father was said to have been affected, making it likely that the retinal degeneration in this family is dominantly inherited. Morimura et al. (1999) detected no alteration of the other allele in the 2 affected individuals or in unaffected members of this family.

[45543] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45544] Mutations in RGR, encoding a light-sensitive opsin homologue, in patients with retinitis pigmentosa. (Letter) Nature Genet. 23: 393-394, 1999. ; and

[45545] Shen, D.; Jiang, M.; Hao, W.; Tao, L.; Salazar, M.; Fong, H. K. W. : A human opsin-related gene that encodes a retinaldehyde-binding protein. Biochemistry 33: 13117-13125, 1994.

[45546] Further studies establishing the function and utilities of RGR are found in John Hopkins OMIM database record ID 600342, and in cited publications numbered 8287-8291 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Solute Carrier Family 2 (facilitated glucose transporter), Member 1 (SLC2A1, Accession NM_006516) is another VGAM1283 host target gene. SLC2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A1 BINDING SITE, designated SEQ ID:13265, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45547] Another function of VGAM1283 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 1 (SLC2A1, Accession NM_006516). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A1. Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459) is another VGAM1283 host target gene. SLC30A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC30A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC30A3 BINDING SITE, designated SEQ ID:9528, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45548] Another function of VGAM1283 is therefore inhibition of Solute Carrier Family 30 (zinc transporter), Member 3 (SLC30A3, Accession NM_003459). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC30A3. Uncoupling Protein 2 (mitochondrial, proton carrier) (UCP2, Accession NM_003355) is another VGAM1283 host target gene. UCP2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by UCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCP2 BINDING SITE, designated SEQ ID:9381, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45549] Another function of VGAM1283 is therefore inhibition of Uncoupling Protein 2 (mitochondrial, proton carrier)

(UCP2, Accession NM_003355), a gene which is an inner mitochondrial membrane transporter and uncouples electron transport from oxidative phosphorylation. Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCP2. The function of UCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1135. Zinc Finger Protein 175 (ZNF175, Accession NM_007147) is another VGAM1283 host target gene. ZNF175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF175 BINDING SITE, designated SEQ ID:13999, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45550] Another function of VGAM1283 is therefore inhibition of Zinc Finger Protein 175 (ZNF175, Accession NM_007147). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with ZNF175. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248) is another VGAM1283 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18368, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45551] Another function of VGAM1283 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM_016248). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. ARP5 (Accession XM_049490) is another VGAM1283 host target gene. ARP5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARP5 BINDING SITE, designated SEQ ID:35440, to the nu-

cleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45552] Another function of VGAM1283 is therefore inhibition of ARP5 (Accession XM_049490). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARP5. BCAA (Accession NM_016374) is another VGAM1283 host target gene. BCAA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCAA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAA BINDING SITE, designated SEQ ID:18512, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45553] Another function of VGAM1283 is therefore inhibition of BCAA (Accession NM_016374). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAA. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM1283 host target gene. C17orf31 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19009, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45554] Another function of VGAM1283 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf31. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837) is another VGAM1283 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16859, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ

ID:3994.

[45555] Another function of VGAM1283 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM_014837). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM1283 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27537, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45556] Another function of VGAM1283 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012)

is another VGAM1283 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:25718, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45557] Another function of VGAM1283 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5. C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 9 (CLECSF9, Accession NM_014358) is another VGAM1283 host target gene. CLECSF9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLECSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF9 BINDING SITE, designated SEQ ID:15690, to the

nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45558] Another function of VGAM1283 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 9 (CLECSF9, Accession NM_014358). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF9. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM1283 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21611, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45559] Another function of VGAM1283 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZP564C103 (Accession NM_015654) is

another VGAM1283 host target gene. DKFZP564C103 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564C103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C103 BINDING SITE, designated SEQ ID:17902, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45560] Another function of VGAM1283 is therefore inhibition of DKFZP564C103 (Accession NM_015654). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C103. DKFZP586I2223 (Accession NM_015438) is another VGAM1283 host target gene. DKFZP586I2223 BINDING SITE1 through DKFZP586I2223 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP586I2223, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE1

through DKFZP586I2223 BINDING SITE3, designated SEQ ID:17734, SEQ ID:28018 and SEQ ID:28020 respectively, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45561] Another function of VGAM1283 is therefore inhibition of DKFZP586I2223 (Accession NM_015438). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223. Fidgetin (FIGN, Accession XM_171005) is another VGAM1283 host target gene. FIGN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FIGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGN BINDING SITE, designated SEQ ID:45776, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45562] Another function of VGAM1283 is therefore inhibition of Fidgetin (FIGN, Accession XM_171005). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGN. FLJ10139 (Accession NM_018005) is another

VGAM1283 host target gene. FLJ10139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10139 BINDING SITE, designated SEQ ID:19735, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45563] Another function of VGAM1283 is therefore inhibition of FLJ10139 (Accession NM_018005). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10139. FLJ12704 (Accession NM_024998) is another VGAM1283 host target gene. FLJ12704 BINDING SITE1 and FLJ12704 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12704, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE1 and FLJ12704 BINDING SITE2, designated SEQ ID:24564 and SEQ ID:24566 respectively, to the nucleotide sequence of

VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45564] Another function of VGAM1283 is therefore inhibition of FLJ12704 (Accession NM_024998). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. FLJ14213 (Accession NM_024841) is another VGAM1283 host target gene. FLJ14213 BINDING SITE1 and FLJ14213 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ14213, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14213 BINDING SITE1 and FLJ14213 BINDING SITE2, designated SEQ ID:24252 and SEQ ID:24253 respectively, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45565] Another function of VGAM1283 is therefore inhibition of FLJ14213 (Accession NM_024841). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14213. FLJ14768 (Accession NM_032836) is another

VGAM1283 host target gene. FLJ14768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14768 BINDING SITE, designated SEQ ID:26615, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45566] Another function of VGAM1283 is therefore inhibition of FLJ14768 (Accession NM_032836). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14768. FLJ20281 (Accession XM_165663) is another VGAM1283 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43725, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45567] Another function of VGAM1283 is therefore inhibition of FLJ20281 (Accession XM_165663). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. FLJ20802 (Accession NM_017959) is another VGAM1283 host target gene. FLJ20802 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20802 BINDING SITE, designated SEQ ID:19675, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45568] Another function of VGAM1283 is therefore inhibition of FLJ20802 (Accession NM_017959). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20802. FLJ22215 (Accession XM_173021) is another VGAM1283 host target gene. FLJ22215 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:46283, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45569] Another function of VGAM1283 is therefore inhibition of FLJ22215 (Accession XM_173021). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. Glucocorticoid Induced Transcript 1 (GLCCI1, Accession XM_166529) is another VGAM1283 host target gene. GLCCI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GLCCI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLCCI1 BINDING SITE, designated SEQ ID:44480, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45570] Another function of VGAM1283 is therefore inhibition of Glucocorticoid Induced Transcript 1 (GLCCI1, Accession XM_166529). Accordingly, utilities of VGAM1283 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GLCCI1. Glycoprotein A33 (transmembrane) (GPA33, Accession NM_005814) is another VGAM1283 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:12407, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45571] Another function of VGAM1283 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM_005814). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. Hippocalcin Like 4 (HPCAL4, Accession NM_016257) is another VGAM1283 host target gene. HPCAL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPCAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of HPCAL4 BINDING SITE, designated SEQ ID:18388, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45572] Another function of VGAM1283 is therefore inhibition of Hippocalcin Like 4 (HPCAL4, Accession NM_016257). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCAL4. KIAA0268 (Accession XM_046126) is another VGAM1283 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:34685, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45573] Another function of VGAM1283 is therefore inhibition of KIAA0268 (Accession XM_046126). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0268. KIAA0523 (Accession XM_041964) is another VGAM1283 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33639, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45574] Another function of VGAM1283 is therefore inhibition of KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA0939 (Accession XM_030524) is another VGAM1283 host target gene. KIAA0939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0939 BINDING SITE, designated SEQ ID:31058, to the nucleotide sequence of VGAM1283 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3994.

[45575] Another function of VGAM1283 is therefore inhibition of KIAA0939 (Accession XM_030524). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0939. KIAA0953 (Accession XM_039733) is another VGAM1283 host target gene. KIAA0953 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33172, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45576] Another function of VGAM1283 is therefore inhibition of KIAA0953 (Accession XM_039733). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. KIAA1280 (Accession XM_045766) is another VGAM1283 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34556, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45577] Another function of VGAM1283 is therefore inhibition of KIAA1280 (Accession XM_045766). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1301 (Accession XM_038999) is another VGAM1283 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32980, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45578] Another function of VGAM1283 is therefore inhibition of KIAA1301 (Accession XM_038999). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1301. KIAA1363 (Accession XM_045056) is another VGAM1283 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34336, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45579] Another function of VGAM1283 is therefore inhibition of KIAA1363 (Accession XM_045056). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1363. KIAA1655 (Accession XM_039442) is another VGAM1283 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33093, to the

nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45580] Another function of VGAM1283 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1879 (Accession XM_056635) is another VGAM1283 host target gene. KIAA1879 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1879 BINDING SITE, designated SEQ ID:36417, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45581] Another function of VGAM1283 is therefore inhibition of KIAA1879 (Accession XM_056635). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1879. LIM and SH3 Protein 1 (LASP1, Accession NM_006148) is another VGAM1283 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12791, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45582] Another function of VGAM1283 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM_006148). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. MGC10960 (Accession NM_032653) is another VGAM1283 host target gene. MGC10960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10960 BINDING SITE, designated SEQ ID:26381, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45583] Another function of VGAM1283 is therefore inhibition of MGC10960 (Accession NM_032653). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10960. MGC12760 (Accession NM_032723) is another VGAM1283 host target gene. MGC12760 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:26449, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45584] Another function of VGAM1283 is therefore inhibition of MGC12760 (Accession NM_032723). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760. MGC5139 (Accession XM_058587) is another VGAM1283 host target gene. MGC5139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5139, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5139 BINDING SITE, designated SEQ ID:36675, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45585] Another function of VGAM1283 is therefore inhibition of MGC5139 (Accession XM_058587). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5139. NIBAN (Accession NM_022083) is another VGAM1283 host target gene. NIBAN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIBAN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIBAN BINDING SITE, designated SEQ ID:22632, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45586] Another function of VGAM1283 is therefore inhibition of NIBAN (Accession NM_022083). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIBAN.

NSG-X (Accession NM_014411) is another VGAM1283 host target gene. NSG-X BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NSG-X, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSG-X BINDING SITE, designated SEQ ID:15755, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45587] Another function of VGAM1283 is therefore inhibition of NSG-X (Accession NM_014411). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSG-X. Nucleoredoxin (NXN, Accession NM_022463) is another VGAM1283 host target gene. NXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXN BINDING SITE, designated SEQ ID:22806, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3994.

[45588] Another function of VGAM1283 is therefore inhibition of Nucleoredoxin (NXN, Accession NM_022463). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXN. poly(rC) Binding Protein 3 (PCBP3, Accession NM_020528) is another VGAM1283 host target gene. PCBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP3 BINDING SITE, designated SEQ ID:21752, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45589] Another function of VGAM1283 is therefore inhibition of poly(rC) Binding Protein 3 (PCBP3, Accession NM_020528). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP3. PI4KII (Accession NM_018425) is another VGAM1283 host target gene. PI4KII BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by PI4KII, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PI4KII BINDING SITE, designated SEQ ID:20484, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45590] Another function of VGAM1283 is therefore inhibition of PI4KII (Accession NM_018425). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PI4KII. PRO0659 (Accession NM_014138) is another VGAM1283 host target gene. PRO0659 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0659, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0659 BINDING SITE, designated SEQ ID:15405, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45591] Another function of VGAM1283 is therefore inhibition of PRO0659 (Accession NM_014138). Accordingly, utilities of

VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0659. Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130842) is another VGAM1283 host target gene. PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2, designated SEQ ID:28367 and SEQ ID:28372 respectively, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45592] Another function of VGAM1283 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM_130842). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2. Sialyltransferase 9 (CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896) is another

VGAM1283 host target gene. SIAT9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIAT9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT9 BINDING SITE, designated SEQ ID:9979, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45593] Another function of VGAM1283 is therefore inhibition of Sialyltransferase 9 (CMP-NeuAc:lactosylceramide alpha-2,3-sialyltransferase; GM3 synthase) (SIAT9, Accession NM_003896). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT9. Tigger Transposable Element Derived 1 (TIGD1, Accession XM_114293) is another VGAM1283 host target gene. TIGD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIGD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIGD1 BINDING SITE, designated SEQ ID:42847, to the nucleotide se-

quence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45594] Another function of VGAM1283 is therefore inhibition of Tigger Transposable Element Derived 1 (TIGD1, Accession XM_114293). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIGD1. WD Repeat Domain 9 (WDR9, Accession NM_033656) is another VGAM1283 host target gene. WDR9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR9 BINDING SITE, designated SEQ ID:27390, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45595] Another function of VGAM1283 is therefore inhibition of WD Repeat Domain 9 (WDR9, Accession NM_033656). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR9. LOC112616 (Accession NM_138410) is another VGAM1283 host target gene.

LOC112616 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112616, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112616 BINDING SITE, designated SEQ ID:28775, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45596] Another function of VGAM1283 is therefore inhibition of LOC112616 (Accession NM_138410). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112616. LOC126364 (Accession XM_065047) is another VGAM1283 host target gene. LOC126364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126364 BINDING SITE, designated SEQ ID:37274, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45597] Another function of VGAM1283 is therefore inhibition of LOC126364 (Accession XM_065047). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126364. LOC145739 (Accession XM_085222) is another VGAM1283 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37964, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45598] Another function of VGAM1283 is therefore inhibition of LOC145739 (Accession XM_085222). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. LOC145845 (Accession XM_096884) is another VGAM1283 host target gene. LOC145845 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145845, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145845 BINDING SITE, designated SEQ ID:40619, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45599] Another function of VGAM1283 is therefore inhibition of LOC145845 (Accession XM_096884). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145845. LOC146909 (Accession XM_085634) is another VGAM1283 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38270, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45600] Another function of VGAM1283 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146909. LOC146957 (Accession XM_085652) is another VGAM1283 host target gene. LOC146957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38282, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45601] Another function of VGAM1283 is therefore inhibition of LOC146957 (Accession XM_085652). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC147791 (Accession XM_097293) is another VGAM1283 host target gene. LOC147791 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147791, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147791 BINDING SITE, designated SEQ ID:40859, to the nucleotide sequence of VGAM1283 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3994.

[45602] Another function of VGAM1283 is therefore inhibition of LOC147791 (Accession XM_097293). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147791. LOC148710 (Accession XM_097506) is another VGAM1283 host target gene. LOC148710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148710 BINDING SITE, designated SEQ ID:40895, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45603] Another function of VGAM1283 is therefore inhibition of LOC148710 (Accession XM_097506). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148710. LOC149372 (Accession XM_086509) is another VGAM1283 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149372, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38727, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45604] Another function of VGAM1283 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC150319 (Accession XM_086816) is another VGAM1283 host target gene. LOC150319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150319 BINDING SITE, designated SEQ ID:38898, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45605] Another function of VGAM1283 is therefore inhibition of LOC150319 (Accession XM_086816). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150319. LOC151154 (Accession XM_098008) is another VGAM1283 host target gene. LOC151154 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151154 BINDING SITE, designated SEQ ID:41304, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45606] Another function of VGAM1283 is therefore inhibition of LOC151154 (Accession XM_098008). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151154. LOC152245 (Accession XM_098182) is another VGAM1283 host target gene. LOC152245 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152245, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152245 BINDING SITE, designated SEQ ID:41450, to

the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45607] Another function of VGAM1283 is therefore inhibition of LOC152245 (Accession XM_098182). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152245. LOC152271 (Accession XM_087419) is another VGAM1283 host target gene. LOC152271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152271 BINDING SITE, designated SEQ ID:39241, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45608] Another function of VGAM1283 is therefore inhibition of LOC152271 (Accession XM_087419). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152271. LOC154860 (Accession XM_098623) is another VGAM1283 host target gene. LOC154860 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC154860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154860 BINDING SITE, designated SEQ ID:41734, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45609] Another function of VGAM1283 is therefore inhibition of LOC154860 (Accession XM_098623). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154860. LOC157681 (Accession XM_088363) is another VGAM1283 host target gene. LOC157681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157681 BINDING SITE, designated SEQ ID:39643, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45610] Another function of VGAM1283 is therefore inhibition of LOC157681 (Accession XM_088363). Accordingly, utilities

of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157681. LOC164714 (Accession XM_104657) is another VGAM1283 host target gene. LOC164714 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164714 BINDING SITE, designated SEQ ID:42177, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45611] Another function of VGAM1283 is therefore inhibition of LOC164714 (Accession XM_104657). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164714. LOC196337 (Accession XM_113696) is another VGAM1283 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196337 BINDING SITE, designated SEQ ID:42362, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45612] Another function of VGAM1283 is therefore inhibition of LOC196337 (Accession XM_113696). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC200982 (Accession XM_117305) is another VGAM1283 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43373, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45613] Another function of VGAM1283 is therefore inhibition of LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC203350 (Accession XM_117536) is another VGAM1283 host target gene. LOC203350 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43539, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45614] Another function of VGAM1283 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC222128 (Accession XM_166560) is another VGAM1283 host target gene. LOC222128 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222128 BINDING SITE, designated SEQ ID:44539, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45615] Another function of VGAM1283 is therefore inhibition of

LOC222128 (Accession XM_166560). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222128. LOC254085 (Accession XM_171189) is another VGAM1283 host target gene. LOC254085 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254085, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254085 BINDING SITE, designated SEQ ID:45973, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45616] Another function of VGAM1283 is therefore inhibition of LOC254085 (Accession XM_171189). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254085. LOC51107 (Accession NM_016022) is another VGAM1283 host target gene. LOC51107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC51107 BINDING SITE, designated SEQ ID:18096, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45617] Another function of VGAM1283 is therefore inhibition of LOC51107 (Accession NM_016022). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51107. LOC51308 (Accession NM_016606) is another VGAM1283 host target gene. LOC51308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51308 BINDING SITE, designated SEQ ID:18711, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45618] Another function of VGAM1283 is therefore inhibition of LOC51308 (Accession NM_016606). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51308. LOC63928 (Accession NM_022097) is another

VGAM1283 host target gene. LOC63928 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC63928, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC63928 BINDING SITE, designated SEQ ID:22636, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45619] Another function of VGAM1283 is therefore inhibition of LOC63928 (Accession NM_022097). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC63928. LOC85414 (Accession NM_033102) is another VGAM1283 host target gene. LOC85414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC85414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85414 BINDING SITE, designated SEQ ID:26950, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45620] Another function of VGAM1283 is therefore inhibition of LOC85414 (Accession NM_033102). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85414. LOC90678 (Accession NM_138361) is another VGAM1283 host target gene. LOC90678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90678 BINDING SITE, designated SEQ ID:28749, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45621] Another function of VGAM1283 is therefore inhibition of LOC90678 (Accession NM_138361). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90678. LOC91151 (Accession NM_033208) is another VGAM1283 host target gene. LOC91151 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91151, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91151 BINDING SITE, designated SEQ ID:27055, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45622] Another function of VGAM1283 is therefore inhibition of LOC91151 (Accession NM_033208). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91151. LOC91301 (Accession XM_037564) is another VGAM1283 host target gene. LOC91301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91301 BINDING SITE, designated SEQ ID:32653, to the nucleotide sequence of VGAM1283 RNA, herein designated VGAM RNA, also designated SEQ ID:3994.

[45623] Another function of VGAM1283 is therefore inhibition of LOC91301 (Accession XM_037564). Accordingly, utilities of VGAM1283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1284 (VGAM1284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45624] VGAM1284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1284 was detected is described hereinabove with reference to Figs. 1–8.

[45625] VGAM1284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus A. VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45626] VGAM1284 gene encodes a VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1284 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1284 precursor RNA is designated SEQ ID:1270, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1270 is located at position 4771 relative to the genome of Human Enterovirus A.

- [45627] VGAM1284 precursor RNA folds onto itself, forming VGAM1284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [45628] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1284 folded precursor RNA into VGAM1284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1284 RNA is designated SEQ ID:3995, and is provided hereinbelow with reference to the sequence listing part.

[45629] VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1284 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45630] VGAM1284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1284 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45631] The complementary binding of VGAM1284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1284 host target RNA into VGAM1284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45632] It is appreciated that VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1284 host target genes. The mRNA of each one of this plurality of VGAM1284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1284 RNA, herein designated VGAM RNA, and which when bound by VGAM1284 RNA causes

inhibition of translation of respective one or more VGAM1284 host target proteins.

[45633] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1284 gene, herein designated VGAM GENE, on one or more VGAM1284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45634] It is yet further appreciated that a function of VGAM1284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1284 include diagnosis, prevention and

treatment of viral infection by Human Enterovirus A. Specific functions, and accordingly utilities, of VGAM1284 correlate with, and may be deduced from, the identity of the host target genes which VGAM1284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45635] Nucleotide sequences of the VGAM1284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1284 are further described hereinbelow with reference to Table 1.

[45636] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1284 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45637] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1284 gene, herein designated VGAM is inhibition of expression of VGAM1284 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1284 correlate with, and may be deduced from, the identity of the target genes which VGAM1284 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45638] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380) is a VGAM1284 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13080, to the nucleotide sequence of VGAM1284 RNA, herein designated VGAM RNA, also designated SEQ ID:3995.

[45639] A function of VGAM1284 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM1284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of

APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525. POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235) is another VGAM1284 host target gene. POU2AF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU2AF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU2AF1 BINDING SITE, designated SEQ ID:12890, to the nucleotide sequence of VGAM1284 RNA, herein designated VGAM RNA, also designated SEQ ID:3995.

[45640] Another function of VGAM1284 is therefore inhibition of POU Domain, Class 2, Associating Factor 1 (POU2AF1, Accession NM_006235), a gene which is a transcriptional coactivator that specifically associates with either oct1 or oct2. Accordingly, utilities of VGAM1284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU2AF1. The function of POU2AF1 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM171.LOC149401 (Accession XM_086511) is another VGAM1284 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38739, to the nucleotide sequence of VGAM1284 RNA, herein designated VGAM RNA, also designated SEQ ID:3995.

[45641] Another function of VGAM1284 is therefore inhibition of LOC149401 (Accession XM_086511). Accordingly, utilities of VGAM1284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149401. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1285 (VGAM1285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45642] VGAM1285 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1285 was detected is described hereinabove with reference to Figs. 1-8.

[45643] VGAM1285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Virus Q. VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45644] VGAM1285 gene encodes a VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1285 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1285 precursor RNA is designated SEQ ID:1271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1271 is located at position 460 relative to the genome of Beet Virus Q.

[45645] VGAM1285 precursor RNA folds onto itself, forming VGAM1285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45646] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1285 folded precursor RNA into VGAM1285 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1285 RNA is designated SEQ ID:3996, and is provided hereinbelow with reference to the sequence listing part.

[45647] VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1285 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45648] VGAM1285 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1285 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45649] The complementary binding of VGAM1285 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1285 host target RNA into VGAM1285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45650] It is appreciated that VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1285 host target genes. The mRNA of each one of this plurality of VGAM1285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1285 RNA, herein designated VGAM RNA, and which when bound by VGAM1285 RNA causes inhibition of translation of respective one or more VGAM1285 host target proteins.

[45651] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1285 gene, herein designated VGAM GENE, on one or more VGAM1285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45652] It is yet further appreciated that a function of VGAM1285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of viral infection by Beet Virus Q. Specific functions, and accordingly utilities, of VGAM1285 correlate with, and may be deduced from, the identity of the host target genes which VGAM1285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45653] Nucleotide sequences of the VGAM1285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1285 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1285 are further described hereinbelow with reference to Table 1.

[45654] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1285 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45655] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1285 gene, herein designated VGAM is inhibition of expression of VGAM1285 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1285 correlate with, and may be deduced from, the identity of the target genes which VGAM1285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45656] Alpha-1-B Glycoprotein (A1BG, Accession NM_130786) is a VGAM1285 host target gene. A1BG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by A1BG, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:28276, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45657] A function of VGAM1285 is therefore inhibition of Alpha-1-B Glycoprotein (A1BG, Accession NM_130786), a gene which a plasma protein of unknown function. Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A1BG. The function of A1BG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is another VGAM1285 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ

ID:12883, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45658] Another function of VGAM1285 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM117. Chromobox Homolog 6 (CBX6, Accession NM_014292) is another VGAM1285 host target gene. CBX6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBX6 BINDING SITE, designated SEQ ID:15577, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45659] Another function of VGAM1285 is therefore inhibition of Chromobox Homolog 6 (CBX6, Accession NM_014292). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBX6. Centaurin, Gamma 2 (CENTG2, Accession NM_014914) is another VGAM1285 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17157, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45660] Another function of VGAM1285 is therefore inhibition of Centaurin, Gamma 2 (CENTG2, Accession NM_014914). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. DKFZP434A0131 (Accession NM_018991) is another VGAM1285 host target gene. DKFZP434A0131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by DKFZP434A0131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434A0131 BINDING SITE, designated SEQ ID:21062, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45661] Another function of VGAM1285 is therefore inhibition of DKFZP434A0131 (Accession NM_018991). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434A0131. Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379) is another VGAM1285 host target gene. KCNV1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNV1 BINDING SITE, designated SEQ ID:15711, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45662] Another function of VGAM1285 is therefore inhibition of

Potassium Channel, Subfamily V, Member 1 (KCNV1, Accession NM_014379). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNV1. MARKL1 (Accession NM_031417) is another VGAM1285 host target gene. MARKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MARKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARKL1 BINDING SITE, designated SEQ ID:25396, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45663] Another function of VGAM1285 is therefore inhibition of MARKL1 (Accession NM_031417). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARKL1. LOC148293 (Accession XM_086138) is another VGAM1285 host target gene. LOC148293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148293, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148293 BINDING SITE, designated SEQ ID:38518, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45664] Another function of VGAM1285 is therefore inhibition of LOC148293 (Accession XM_086138). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148293. LOC220018 (Accession XM_167816) is another VGAM1285 host target gene. LOC220018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220018 BINDING SITE, designated SEQ ID:44857, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45665] Another function of VGAM1285 is therefore inhibition of LOC220018 (Accession XM_167816). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220018. LOC86651 (Accession XM_044052) is another VGAM1285 host target gene. LOC86651 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC86651, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC86651 BINDING SITE, designated SEQ ID:34099, to the nucleotide sequence of VGAM1285 RNA, herein designated VGAM RNA, also designated SEQ ID:3996.

[45666] Another function of VGAM1285 is therefore inhibition of LOC86651 (Accession XM_044052). Accordingly, utilities of VGAM1285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC86651. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1286 (VGAM1286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45667] VGAM1286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1286 was detected is described hereinabove with reference to Figs. 1–8.

[45668] VGAM1286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus A. VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45669] VGAM1286 gene encodes a VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1286 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1286 precursor RNA is designated SEQ ID:1272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1272 is located at position 1767 relative to the genome of Human Enterovirus A.

[45670] VGAM1286 precursor RNA folds onto itself, forming VGAM1286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45671] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1286 folded precursor RNA into VGAM1286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1286 RNA is designated SEQ ID:3997, and is provided hereinbelow with reference to the sequence listing part.

[45672] VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1286 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45673] VGAM1286 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1286 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45674] The complementary binding of VGAM1286 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1286 host target RNA into VGAM1286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45675] It is appreciated that VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1286 host target genes. The mRNA of each one of this plurality of VGAM1286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1286 RNA, herein designated VGAM RNA, and which when bound by VGAM1286 RNA causes inhibition of translation of respective one or more VGAM1286 host target proteins.

[45676] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1286 gene, herein designated VGAM GENE, on one or more VGAM1286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45677] It is yet further appreciated that a function of VGAM1286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of viral infection by Human Enterovirus A. Specific functions, and accordingly utilities, of VGAM1286 correlate with, and may be deduced from, the identity of the host target genes which VGAM1286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45678] Nucleotide sequences of the VGAM1286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1286 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1286 are further described hereinbelow with reference to Table 1.

[45679] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1286 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45680] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1286 gene, herein designated VGAM is inhibition of expression of VGAM1286 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1286 correlate with, and may be deduced from, the identity of the target genes which VGAM1286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45681] Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131) is a VGAM1286 host target gene. C1orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf6, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf6 BINDING SITE, designated SEQ ID:21328, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45682] A function of VGAM1286 is therefore inhibition of Chromosome 1 Open Reading Frame 6 (C1orf6, Accession NM_020131), a gene which may link ataxin-1 with the chaperone and ubiquitin/proteasome pathways . Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf6. The function of C1orf6 has been established by previous studies. By a yeast 2-hybrid screen of an adult human brain cDNA library, Davidson et al. (2000) isolated cDNA clones which they used to assemble a complete cDNA encoding the 601-amino acid ataxin-1 ubiquitin-like interacting protein (A1U). Sequence comparison revealed that A1U contains an N-terminal ubiquitin-like region, placing it within a large family of similar proteins. In addition, A1U shows substantial homology to human UBQLN2 (OMIM Ref. No. 300264), a protein that binds the ATPase domain of the HSP70-like STCH protein (OMIM

Ref. No. 601100). Expression analyses demonstrated that A1U mRNA is widely expressed as a 4.0-kb transcript and is present in Purkinje cells, the primary site of spinocerebellar ataxia-1 (SCA1; 164400) cerebellar pathology. The A1U protein localized to the nucleus and cytoplasm of transfected COS-1 cells. Sequences important for the transport of A1U into the nucleus appeared to lie within the C terminus. In the nucleus, A1U colocalized with mutant ataxin-1 (ATX1; 601556), further demonstrating that A1U interacts with ataxin-1. Davidson et al. (2000) suggested that A1U may link ataxin-1 with the chaperone and ubiquitin/proteasome pathways and that ataxin-1 may function in the formation and regulation of multimeric protein complexes within the nucleus.

[45683] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45684] Davidson, J. D.; Riley, B.; Burright, E.N.; Duvick, L.A.; Zoghbi, H.Y.; Orr, H. T. : Identification and characterization of an ataxin-1-interacting protein: A1Up, a ubiquitin-like nuclear protein. Hum. Molec. Genet. 9: 2305-2312, 2000. ; and

[45685] Fogli, A.; Giglio, S.; Arrigo, G.; Lo Nigro, C.; Zollo, M.; Vig-

giano, L.; Rocchi, M.; Archidiacono, N.; Zuffardi, O.; Carozzo, R. : Identification of two paralogous regions mapping to.

[45686] Further studies establishing the function and utilities of C1orf6 are found in John Hopkins OMIM database record ID 605440, and in cited publications numbered 4794 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630) is another VGAM1286 host target gene. PEX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX3 BINDING SITE, designated SEQ ID:9690, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45687] Another function of VGAM1286 is therefore inhibition of Peroxisomal Biogenesis Factor 3 (PEX3, Accession NM_003630). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX3. BCMP1 (Accession

NM_031442) is another VGAM1286 host target gene.

BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25454, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45688] Another function of VGAM1286 is therefore inhibition of BCMP1 (Accession NM_031442). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. DKFZP434F1735 (Accession NM_015590) is another VGAM1286 host target gene. DKFZP434F1735 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434F1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F1735 BINDING SITE, designated SEQ ID:17857, to the nucleotide sequence of VGAM1286

RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45689] Another function of VGAM1286 is therefore inhibition of DKFZP434F1735 (Accession NM_015590). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F1735. FLJ21106 (Accession NM_025097) is another VGAM1286 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24733, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45690] Another function of VGAM1286 is therefore inhibition of FLJ21106 (Accession NM_025097). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. KIAA0914 (Accession NM_014883) is another VGAM1286 host target gene. KIAA0914 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0914 BINDING SITE, designated SEQ ID:17032, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45691] Another function of VGAM1286 is therefore inhibition of KIAA0914 (Accession NM_014883). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0914. KIAA1287 (Accession XM_085753) is another VGAM1286 host target gene. KIAA1287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1287 BINDING SITE, designated SEQ ID:38324, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45692] Another function of VGAM1286 is therefore inhibition of KIAA1287 (Accession XM_085753). Accordingly, utilities

of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1287. Mitochondrial Ribosomal Protein S14 (MRPS14, Accession NM_022100) is another VGAM1286 host target gene. MRPS14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS14 BINDING SITE, designated SEQ ID:22641, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45693] Another function of VGAM1286 is therefore inhibition of Mitochondrial Ribosomal Protein S14 (MRPS14, Accession NM_022100). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS14. LOC91351 (Accession XM_037817) is another VGAM1286 host target gene. LOC91351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91351 BINDING SITE, designated SEQ ID:32695, to the nucleotide sequence of VGAM1286 RNA, herein designated VGAM RNA, also designated SEQ ID:3997.

[45694] Another function of VGAM1286 is therefore inhibition of LOC91351 (Accession XM_037817). Accordingly, utilities of VGAM1286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91351. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1287 (VGAM1287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45695] VGAM1287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1287 was detected is described hereinabove with reference to Figs. 1-8.

[45696] VGAM1287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Beet Virus Q. VGAM1287 host target gene, herein designated VGAM HOST TARGET

GENE, is a human gene contained in the human genome.

[45697] VGAM1287 gene encodes a VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1287 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1287 precursor RNA is designated SEQ ID:1273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1273 is located at position 1305 relative to the genome of Beet Virus Q.

[45698] VGAM1287 precursor RNA folds onto itself, forming VGAM1287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1287 folded precursor RNA into VGAM1287 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1287 RNA is designated SEQ ID:3998, and is provided hereinbelow with reference to the sequence listing part.

[45700] VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1287 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45701] VGAM1287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1287 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45702] The complementary binding of VGAM1287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1287 host target RNA into VGAM1287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45703] It is appreciated that VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1287 host target genes. The mRNA of each one of this plurality of VGAM1287 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1287 RNA, herein designated VGAM RNA, and which when bound by VGAM1287 RNA causes inhibition of translation of respective one or more VGAM1287 host target proteins.

[45704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1287 gene, herein designated VGAM GENE, on one or more VGAM1287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45705] It is yet further appreciated that a function of VGAM1287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of viral infection by Beet Virus Q. Specific functions, and accordingly utilities, of VGAM1287 correlate with, and may be deduced from, the identity of the host target genes which VGAM1287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45706] Nucleotide sequences of the VGAM1287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1287 are further described hereinbelow with reference to Table 1.

[45707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1287 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1287 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45708] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1287 gene, herein designated VGAM is inhibition of expression of VGAM1287 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1287 correlate with, and may be deduced from, the identity of the target genes which VGAM1287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45709] ATPase, Cu⁺⁺ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is a VGAM1287 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5492, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:3998.

[45710] A function of VGAM1287 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. CGTHBA (Accession NM_012075) is another VGAM1287 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14355, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45711] Another function of VGAM1287 is therefore inhibition of CGTHBA (Accession NM_012075). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053) is another VGAM1287 host target gene. ESRRG BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32997, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45712] Another function of VGAM1287 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is another VGAM1287 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6045, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45713] Another function of VGAM1287 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169) is another VGAM1287 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18251, to the nucleotide sequence of

VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45714] Another function of VGAM1287 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. DJ971N18.2 (Accession NM_021156) is another VGAM1287 host target gene. DJ971N18.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ971N18.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ971N18.2 BINDING SITE, designated SEQ ID:22133, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45715] Another function of VGAM1287 is therefore inhibition of DJ971N18.2 (Accession NM_021156). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ971N18.2. FLJ20079 (Accession NM_017656) is another VGAM1287 host target gene. FLJ20079 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19170, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45716] Another function of VGAM1287 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. KIAA1949 (Accession XM_175173) is another VGAM1287 host target gene. KIAA1949 BINDING SITE1 through KIAA1949 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1949, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1949 BINDING SITE1 through KIAA1949 BINDING SITE3, designated SEQ ID:46667, SEQ ID:44208 and SEQ ID:46712 respectively, to the nucleotide sequence of VGAM1287 RNA, herein designated

VGAM RNA, also designated SEQ ID:3998.

[45717] Another function of VGAM1287 is therefore inhibition of KIAA1949 (Accession XM_175173). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1949. Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM_099029) is another VGAM1287 host target gene. TTY2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY2 BINDING SITE, designated SEQ ID:42070, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45718] Another function of VGAM1287 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM_099029). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY2. LOC159148 (Accession XM_099030) is another VGAM1287 host target gene. LOC159148 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:42077, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45719] Another function of VGAM1287 is therefore inhibition of LOC159148 (Accession XM_099030). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC199692 (Accession NM_145295) is another VGAM1287 host target gene. LOC199692 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:29810, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45720] Another function of VGAM1287 is therefore inhibition of

LOC199692 (Accession NM_145295). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199692. LOC91012 (Accession XM_035503) is another VGAM1287 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32280, to the nucleotide sequence of VGAM1287 RNA, herein designated VGAM RNA, also designated SEQ ID:3998.

[45721] Another function of VGAM1287 is therefore inhibition of LOC91012 (Accession XM_035503). Accordingly, utilities of VGAM1287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1288 (VGAM1288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[45722] VGAM1288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1288 was detected is described hereinabove with reference to Figs. 1–8.

[45723] VGAM1288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45724] VGAM1288 gene encodes a VGAM1288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1288 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1288 precursor RNA is designated SEQ ID:1274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1274 is located at position 9116 relative to the genome of Saimiriine Herpesvirus 2.

[45725] VGAM1288 precursor RNA folds onto itself, forming VGAM1288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45726] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1288 folded precursor RNA into VGAM1288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1288 RNA is designated SEQ ID:3999, and is provided hereinbelow with reference to the sequence listing part.

[45727] VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1288 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[45728] VGAM1288 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1288 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[45729] The complementary binding of VGAM1288 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1288 host target RNA into VGAM1288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45730] It is appreciated that VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1288 host target genes. The mRNA of each one of this plurality of VGAM1288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1288 RNA, herein designated VGAM RNA, and which when bound by VGAM1288 RNA causes inhibition of translation of respective one or more VGAM1288 host target proteins.

[45731] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1288 gene, herein designated VGAM GENE, on one

or more VGAM1288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45732] It is yet further appreciated that a function of VGAM1288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1288 correlate with, and may be deduced from, the identity of the host target genes which VGAM1288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45733] Nucleotide sequences of the VGAM1288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1288 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1288 are further described hereinbelow with reference to Table 1.

[45734] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1288 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45735] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1288 gene, herein designated VGAM is inhibition of expression of VGAM1288 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1288 correlate with, and may be deduced from, the identity of the target genes which VGAM1288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45736] Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase)

(FUT6, Accession NM_000150) is a VGAM1288 host target gene. FUT6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FUT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:5649, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45737] A function of VGAM1288 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM_000150), a gene which is involved in the biosynthesis of the e-selectin ligand, sialyl-lewis x. catalyzes the transfer of fucose from gdp- beta-fucose to alpha-2,3 sialylated substrates. Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6. The function of FUT6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM194. Protein Kinase C, Nu (PRKCN, Accession NM_005813) is another VGAM1288 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12399, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45738] Another function of VGAM1288 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM_005813). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 2 (SMARCD2, Accession NM_003077) is another VGAM1288 host target gene. SMARCD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMARCD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD2 BINDING SITE, designated SEQ ID:9052, to the nucleotide sequence of VGAM1288 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3999.

[45739] Another function of VGAM1288 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 2 (SMARCD2, Accession NM_003077), a gene which is involved in chromatin remodeling. Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD2. The function of SMARCD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM554. Surfeit 5 (SURF5, Accession NM_006752) is another VGAM1288 host target gene. SURF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SURF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SURF5 BINDING SITE, designated SEQ ID:13605, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45740] Another function of VGAM1288 is therefore inhibition of

Surfeit 5 (SURF5, Accession NM_006752). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SURF5. FLJ11142 (Accession NM_018338) is another VGAM1288 host target gene. FLJ11142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11142 BINDING SITE, designated SEQ ID:20342, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45741] Another function of VGAM1288 is therefore inhibition of FLJ11142 (Accession NM_018338). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11142. KIAA0256 (Accession XM_034905) is another VGAM1288 host target gene. KIAA0256 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0256 BINDING SITE, designated SEQ ID:32186, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45742] Another function of VGAM1288 is therefore inhibition of KIAA0256 (Accession XM_034905). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0256. KIAA1450 (Accession XM_038035) is another VGAM1288 host target gene. KIAA1450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1450 BINDING SITE, designated SEQ ID:32748, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45743] Another function of VGAM1288 is therefore inhibition of KIAA1450 (Accession XM_038035). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1450. KIAA1829 (Accession XM_030378) is another

VGAM1288 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31032, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45744] Another function of VGAM1288 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. PRO1580 (Accession NM_018502) is another VGAM1288 host target gene. PRO1580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1580 BINDING SITE, designated SEQ ID:20566, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45745] Another function of VGAM1288 is therefore inhibition of PRO1580 (Accession NM_018502). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1580. LOC149373 (Accession XM_086507) is another VGAM1288 host target gene. LOC149373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149373 BINDING SITE, designated SEQ ID:38718, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45746] Another function of VGAM1288 is therefore inhibition of LOC149373 (Accession XM_086507). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149373. LOC165246 (Accession XM_092473) is another VGAM1288 host target gene. LOC165246 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165246, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165246 BINDING SITE, designated SEQ ID:40126, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45747] Another function of VGAM1288 is therefore inhibition of LOC165246 (Accession XM_092473). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165246. LOC256207 (Accession XM_170837) is another VGAM1288 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45620, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45748] Another function of VGAM1288 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256207. LOC90459 (Accession XM_031826) is another VGAM1288 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:31489, to the nucleotide sequence of VGAM1288 RNA, herein designated VGAM RNA, also designated SEQ ID:3999.

[45749] Another function of VGAM1288 is therefore inhibition of LOC90459 (Accession XM_031826). Accordingly, utilities of VGAM1288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1289 (VGAM1289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45750] VGAM1289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1289 was detected is described hereinabove with reference to Figs. 1–8.

[45751] VGAM1289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45752] VGAM1289 gene encodes a VGAM1289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1289 precursor RNA is designated SEQ ID:1275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1275 is located at position 9692 relative to the genome of Saimiriine Herpesvirus 2.

[45753] VGAM1289 precursor RNA folds onto itself, forming VGAM1289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45754] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1289 folded precursor RNA into VGAM1289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1289 RNA is designated SEQ ID:4000, and is provided hereinbelow with reference to the sequence listing part.

[45755] VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1289 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45756] VGAM1289 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1289 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45757] The complementary binding of VGAM1289 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1289 host target RNA into VGAM1289 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45758] It is appreciated that VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1289 host target genes. The mRNA of each one of this plurality of VGAM1289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1289 RNA, herein designated VGAM RNA, and which when bound by VGAM1289 RNA causes inhibition of translation of respective one or more VGAM1289 host target proteins.

[45759] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1289 gene, herein designated VGAM GENE, on one or more VGAM1289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45760] It is yet further appreciated that a function of VGAM1289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1289 correlate with, and may be deduced from, the identity of the host target genes which VGAM1289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45761] Nucleotide sequences of the VGAM1289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1289 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1289 are further described hereinbelow with reference to Table 1.

[45762] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1289 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45763] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1289 gene, herein designated VGAM is inhibition of expression of VGAM1289 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1289 correlate with, and may be deduced from, the identity of the target genes which VGAM1289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45764] Cyclin D2 (CCND2, Accession NM_001759) is a VGAM1289 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7513, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45765] A function of VGAM1289 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. EphA2 (EPHA2, Accession NM_004431) is another VGAM1289 host target gene. EPHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA2 BINDING SITE, designated SEQ ID:10714, to the nucleotide se-

quence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45766] Another function of VGAM1289 is therefore inhibition of EphA2 (EPHA2, Accession NM_004431), a gene which binds to ephrin-a1, -a3, -a4 and -a5. Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA2. The function of EPHA2 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. By screening a HeLa cell cDNA library with degenerate oligonucleotides based on highly conserved regions of receptor protein-tyrosine kinases, Lindberg and Hunter (1990) isolated cDNAs encoding EPHA2, named ECK by them. The predicted 976-amino acid protein consists of a 534-amino acid external domain that includes a signal peptide; a 24-amino acid transmembrane domain; and a 418-amino acid cytoplasmic domain that contains a canonical protein-tyrosine kinase catalytic domain. Immunoprecipitated ECK from human cells migrated as an approximately 125- to 130-kD doublet by SDS-PAGE. Northern blot analysis detected an approximately 4.7-kb ECK transcript in human cells. Rat ECK mRNA is highly expressed in tissues that

contain a high proportion of epithelial cells, including lung, skin, small intestine, and ovary. Immunohistochemical analysis detected rat Eck protein in lung and kidney epithelial cells. By somatic cell hybrid analysis and fluorescence in situ hybridization, Sulman et al. (1997) mapped the EPHA2 gene, called ECK by them, to 1p36.1. They noted that there appears to be clusters of EPH genes on several chromosomes. Ganju et al. (1994) mapped the mouse Eck gene to the distal region of chromosome 4, between the Akp2 (OMIM Ref. No. 171760) and Gpd1 (OMIM Ref. No. 138420) genes. They noted that this region shows homology of synteny with human 1p36-p34.

[45767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45768] Lindberg, R. A.; Hunter, T. : cDNA cloning and characterization of eck, an epithelial cell receptor-tyrosine kinase in the eph/elk family of protein kinases. Molec. Cell. Biol. 10: 6316-6324, 1990. ; and

[45769] Sulman, E. P.; Tang, X. X.; Allen, C.; Biegel, J. A.; Pleasure, D. E.; Brodeur, G. M.; Ikegaki, N. : ECK, a human EPH-related gene, maps to 1p36.1, a common region of alteration in human.

[45770] Further studies establishing the function and utilities of EPHA2 are found in John Hopkins OMIM database record ID 176946, and in cited publications numbered 12702–12704 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788) is another VGAM1289 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11197, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45771] Another function of VGAM1289 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with UBE4A. The function of UBE4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60.DKFZP434P0721 (Accession XM_033181) is another VGAM1289 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:31874, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45772] Another function of VGAM1289 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. FLJ10287 (Accession NM_019083) is another VGAM1289 host target gene. FLJ10287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10287, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10287 BINDING SITE, designated SEQ ID:21155, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45773] Another function of VGAM1289 is therefore inhibition of FLJ10287 (Accession NM_019083). Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10287. FLJ10607 (Accession XM_085119) is another VGAM1289 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10607 BINDING SITE, designated SEQ ID:37835, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45774] Another function of VGAM1289 is therefore inhibition of FLJ10607 (Accession XM_085119). Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ10607. KIAA0182 (Accession XM_050495) is another VGAM1289 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35646, to the nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45775] Another function of VGAM1289 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA1908 (Accession XM_055834) is another VGAM1289 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36327, to the

nucleotide sequence of VGAM1289 RNA, herein designated VGAM RNA, also designated SEQ ID:4000.

[45776] Another function of VGAM1289 is therefore inhibition of KIAA1908 (Accession XM_055834). Accordingly, utilities of VGAM1289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1290 (VGAM1290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45777] VGAM1290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1290 was detected is described hereinabove with reference to Figs. 1–8.

[45778] VGAM1290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Grapevine Fleck Virus. VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45779] VGAM1290 gene encodes a VGAM1290 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1290 precursor RNA is designated SEQ ID:1276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1276 is located at position 5505 relative to the genome of Grapevine Fleck Virus.

[45780] VGAM1290 precursor RNA folds onto itself, forming VGAM1290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45781] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1290 folded precursor RNA into VGAM1290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1290 RNA is designated SEQ ID:4001, and is provided hereinbelow with reference to the sequence listing part.

[45782] VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1290 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45783] VGAM1290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1290 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45784] The complementary binding of VGAM1290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1290 host target RNA into VGAM1290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45785] It is appreciated that VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1290 host target genes. The mRNA of each one of this plurality of VGAM1290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1290 RNA, herein designated VGAM RNA, and which when bound by VGAM1290 RNA causes inhibition of translation of respective one or more VGAM1290 host target proteins.

[45786] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1290 gene, herein designated VGAM GENE, on one or more VGAM1290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[45787] It is yet further appreciated that a function of VGAM1290 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of viral infection by Grapevine Fleck Virus. Specific functions, and accordingly utilities, of VGAM1290 correlate with, and may be deduced from, the identity of the host target genes which VGAM1290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45788] Nucleotide sequences of the VGAM1290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1290 are further described hereinbelow with reference to Table 1.

[45789] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1290 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45790] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1290 gene, herein designated VGAM is inhibition of expression of VGAM1290 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1290 correlate with, and may be deduced from, the identity of the target genes which VGAM1290 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45791] Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is a VGAM1290 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6844, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45792] A function of VGAM1290 is therefore inhibition of Rho

GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Cathepsin B (CTSB, Accession XM_035662) is another VGAM1290 host target gene. CTSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSB BINDING SITE, designated SEQ ID:32327, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45793] Another function of VGAM1290 is therefore inhibition of Cathepsin B (CTSB, Accession XM_035662). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CTSB. Dystrophin Myotonic-protein Kinase (DMPK, Accession NM_004409) is another VGAM1290 host target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10661, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45794] Another function of VGAM1290 is therefore inhibition of Dystrophin Myotonic-protein Kinase (DMPK, Accession NM_004409). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. DNA (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM_013369) is another VGAM1290 host target gene. DNMT3L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DNMT3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3L BINDING SITE, designated SEQ

ID:15017, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45795] Another function of VGAM1290 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3-like (DNMT3L, Accession NM_013369), a gene which plays a role in de novo methylation of CpG islands. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3L. The function of DNMT3L and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM447. Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055) is another VGAM1290 host target gene. GFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:7812, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45796] Another function of VGAM1290 is therefore inhibition of

Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFAP. Mucin 3B (MUC3B, Accession XM_168578) is another VGAM1290 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45252, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45797] Another function of VGAM1290 is therefore inhibition of Mucin 3B (MUC3B, Accession XM_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM55. Mucin 4, Tracheobronchial (MUC4, Accession NM_138298) is another VGAM1290 host target gene. MUC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC4 BINDING SITE, designated SEQ ID:28710, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45798] Another function of VGAM1290 is therefore inhibition of Mucin 4, Tracheobronchial (MUC4, Accession NM_138298), a gene which may act as a ligand for ErbB2 mediated cell signalling. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC4. The function of MUC4 has been established by previous studies. From a lambda-gt11 cDNA library constructed from human tracheobronchial mucosa, Porchet et al. (1991) isolated a partial cDNA clone that reacted with a polyclonal antiserum raised to chemically deglycosylated pronase glycopeptides from human bronchial mucins. The

novel tracheobronchial mucin gene, referred to as mucin 4, was mapped to chromosome 3 by analysis of somatic cell hybrids. By in situ hybridization, Van Cong et al. (1991) mapped MUC4 to 3q29. They also demonstrated a VNTR polymorphism useful for family linkage studies. The full report was given by Gross et al. (1992). (Note that Nguyen Van Cong's name is sometimes published as Nguyen, V. C. rather than Van Cong, N. Nguyen is indeed the surname.)

[45799] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45800] Gross, M.-S.; Guyonnet-Duperat, V.; Porchet, N.; Bernheim, A.; Aubert, J. P.; Nguyen, V. C. : Mucin 4 (MUC4) gene: regional assignment (3q29) and RFLP analysis. Ann. Genet. 35: 21-26, 1992. ; and

[45801] Porchet, N.; Van Cong, N.; Dufosse, J.; Audie, J. P.; Guyonnet-Duperat, V.; Gross, M. S.; Denis, C.; Degand, P.; Bernheim, A.; Aubert, J. P. : Molecular cloning and chromosomal localization.

[45802] Further studies establishing the function and utilities of MUC4 are found in John Hopkins OMIM database record ID 158372, and in cited publications numbered 3797-3799

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM_000539) is another VGAM1290 host target gene. RHO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHO BINDING SITE, designated SEQ ID:6138, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45803] Another function of VGAM1290 is therefore inhibition of Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM_000539). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM_005432) is another VGAM1290 host target gene. XRCC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

XRCC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC3 BINDING SITE, designated SEQ ID:11907, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45804] Another function of VGAM1290 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 3 (XRCC3, Accession NM_005432), a gene which is required for meiotic recombination, synaptonemal complex formation and cell cycle progression. Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC3. The function of XRCC3 has been established by previous studies. Masson et al. (2001) found that antibody directed against RAD51C (OMIM Ref. No. 602774) coimmunoprecipitated XRCC2 in an endogenous complex with RAD51C in HeLa cell lysates. Gel filtration of the complex suggested that a heterodimer is formed between the proteins. Using coprecipitation and multiple pull-down assays, Liu et al. (2002) confirmed interaction between these proteins. They also found that

RAD51 coprecipitates with XRCC3, suggesting that RAD51 can be present in a trimeric complex of XRCC3, RAD51C, and RAD51. Brenneman et al. (2002) found that XRCC3 mutant cells displayed radically altered homologous recombination (HR) product spectra, with increased gene conversion tract lengths, increased frequencies of discontinuous tracts, and frequent local rearrangements associated with HR. These results indicated that XRCC3 function is not limited to HR initiation, but extends to later stages in formation and resolution of HR intermediates, possibly by stabilizing heteroduplex DNA. The results further demonstrated that HR defects can promote genomic instability not only through failure to initiate HR (leading to nonhomologous repair), but also through aberrant processing of HR intermediates. The authors suggested that both mechanisms may contribute to carcinogenesis in HR-deficient cells.

[45805] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45806] Masson, J.-Y.; Tarsounas, M. C.; Stasiak, A. Z.; Stasiak, A.; Shah, R.; McIlwraith, M. J.; Benson, F. E.; West, S. C. : Identification and purification of two distinct complexes con-

taining the five RAD51 paralogs. Genes Dev. 15:
3296–3307, 2001. ; and

[45807] Brenneman, M. A.; Wagener, B. M.; Miller, C. A.; Allen, C.; Nickoloff, J. A. : XRCC3 controls the fidelity of homologous recombination: roles for XRCC3 in late stages of recombination.

[45808] Further studies establishing the function and utilities of XRCC3 are found in John Hopkins OMIM database record ID 600675, and in cited publications numbered 9920–9921, 1602–160 and 9922–9923 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Docking Protein 4 (DOK4, Accession NM_018110) is another VGAM1290 host target gene. DOK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOK4 BINDING SITE, designated SEQ ID:19880, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45809] Another function of VGAM1290 is therefore inhibition of Docking Protein 4 (DOK4, Accession NM_018110). Ac-

cordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOK4. FLJ12910 (Accession NM_024573) is another VGAM1290 host target gene. FLJ12910 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12910 BINDING SITE, designated SEQ ID:23799, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45810] Another function of VGAM1290 is therefore inhibition of FLJ12910 (Accession NM_024573). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12910. KIAA1130 (Accession XM_031104) is another VGAM1290 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1130 BINDING SITE, designated SEQ ID:31282, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45811] Another function of VGAM1290 is therefore inhibition of KIAA1130 (Accession XM_031104). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1297 (Accession XM_051005) is another VGAM1290 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35709, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45812] Another function of VGAM1290 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. N-myristoyltransferase 1 (NMT1, Accession NM_021079) is another VGAM1290 host target gene.

NMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NMT1 BINDING SITE, designated SEQ ID:22048, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45813] Another function of VGAM1290 is therefore inhibition of N-myristoyltransferase 1 (NMT1, Accession NM_021079). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NMT1. Phosphatase, Orphan 1 (phospho1, Accession XM_091572) is another VGAM1290 host target gene. phospho1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by phospho1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of phospho1 BINDING SITE, designated SEQ ID:40060, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45814] Another function of VGAM1290 is therefore inhibition of Phosphatase, Orphan 1 (phospho1, Accession XM_091572). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with phospho1. LOC149606 (Accession XM_086600) is another VGAM1290 host target gene. LOC149606 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149606 BINDING SITE, designated SEQ ID:38781, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45815] Another function of VGAM1290 is therefore inhibition of LOC149606 (Accession XM_086600). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149606. LOC206426 (Accession XM_116505) is another VGAM1290 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC206426, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43117, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45816] Another function of VGAM1290 is therefore inhibition of LOC206426 (Accession XM_116505). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC221486 (Accession XM_165760) is another VGAM1290 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43741, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45817] Another function of VGAM1290 is therefore inhibition of LOC221486 (Accession XM_165760). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221486. LOC91208 (Accession XM_036935) is another VGAM1290 host target gene. LOC91208 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91208 BINDING SITE, designated SEQ ID:32522, to the nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45818] Another function of VGAM1290 is therefore inhibition of LOC91208 (Accession XM_036935). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91208. LOC93589 (Accession XM_052387) is another VGAM1290 host target gene. LOC93589 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93589 BINDING SITE, designated SEQ ID:35977, to the

nucleotide sequence of VGAM1290 RNA, herein designated VGAM RNA, also designated SEQ ID:4001.

[45819] Another function of VGAM1290 is therefore inhibition of LOC93589 (Accession XM_052387). Accordingly, utilities of VGAM1290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1291 (VGAM1291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45820] VGAM1291 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1291 was detected is described hereinabove with reference to Figs. 1–8.

[45821] VGAM1291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus.

VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45822] VGAM1291 gene encodes a VGAM1291 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1291 precursor RNA is designated SEQ ID:1277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1277 is located at position 74471 relative to the genome of Swinepox Virus.

[45823] VGAM1291 precursor RNA folds onto itself, forming VGAM1291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45824] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1291 folded precursor RNA into VGAM1291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1291 RNA is designated SEQ ID:4002, and is provided hereinbelow with reference to the sequence listing part.

[45825] VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1291 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45826] VGAM1291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1291 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45827] The complementary binding of VGAM1291 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1291 host target RNA into VGAM1291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45828] It is appreciated that VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1291 host target genes. The mRNA of each one of this plurality of VGAM1291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1291 RNA, herein designated VGAM RNA, and which when bound by VGAM1291 RNA causes inhibition of translation of respective one or more VGAM1291 host target proteins.

[45829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1291 gene, herein designated VGAM GENE, on one or more VGAM1291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[45830] It is yet further appreciated that a function of VGAM1291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific functions, and accordingly utilities, of VGAM1291 correlate with, and may be deduced from, the identity of the host target genes which VGAM1291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45831] Nucleotide sequences of the VGAM1291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1291 are further described hereinbelow with reference to Table 1.

[45832] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1291 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45833] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1291 gene, herein designated VGAM is inhibition of expression of VGAM1291 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1291 correlate with, and may be deduced from, the identity of the target genes which VGAM1291 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45834] Interleukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349) is a VGAM1291 host target gene. IRAK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRAK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK4 BINDING SITE, designated SEQ ID:30693, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45835] A function of VGAM1291 is therefore inhibition of Inter-

leukin-1 Receptor-associated Kinase 4 (IRAK4, Accession XM_028349), a gene which may function as an IRAK1 kinase, triggering a cascade of phosphorylation events. Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK4. The function of IRAK4 has been established by previous studies. By SEREX (serologic analysis of recombinant cDNA expression libraries) screening of renal tumors, Scanlan et al. (1999) identified multiple antigens, including REN64. The deduced 460-amino acid protein is strongly expressed in kidney, as determined by immunohistochemistry. RT-PCR analysis detected expression in all 6 tissues tested (lung, testis, small intestine, breast, liver, and placenta). By database searching for IRAK-like sequences and PCR of a universal cDNA library, Li et al. (2002) obtained a cDNA encoding IRAK4, which is 98% identical to REN64. The predicted protein is 84% identical to the mouse protein and, like IRAK1, IRAK2 (OMIM Ref. No. 603304), IRAKM (OMIM Ref. No. 604459), and the Drosophila Pelle protein, it has an N-terminal death domain and a central kinase domain. Unlike the other IRAK proteins, however, but similar to Pelle, IRAK4 has a short C-terminal domain. Northern blot analysis re-

vealed expression of 3.0- and 4.4-kb transcripts, with strongest expression in kidney and liver. RT-PCR analysis detected wide, low-level expression of IRAK4. Functional analysis by Li et al. (2002) determined that IRAK4, like IRAK1 and Pelle, has auto- and cross-phosphorylation kinase activity. Precipitation and binding analyses showed weak interaction between IRAK4 and IRAK1, but IRAK4 did not interact with other IRAK family members. Overexpressed IRAK4 interacted with MYD88 (OMIM Ref. No. 602170) and TRAF6 (OMIM Ref. No. 602355) and activated mitogen-activated protein kinase (MAPK) and nuclear factor kappa-B (NFKB; 164011) pathways. Endogenous IRAK4 associated in a transient IL1 (see OMIM Ref. No. 147720)-dependent manner with unmodified IRAK1 and TRAF6. Luciferase reporter analysis showed that IRAK4 lacking the kinase domain inhibited IL1- but not tumor necrosis factor (TNF; 191160)- induced NFKB and IRAK1 activation. SDS-PAGE and autoradiographic analysis indicated that IRAK4 phosphorylates and activates IRAK1 at thr387, but not vice versa. Li et al. (2002) proposed that IRAK4 acts upstream of other IRAKs and may function as an IRAK1 kinase, triggering a cascade of phosphorylation events By gene targeting, Suzuki et al. (2002) generated

mice deficient in Irak4. Mutant mice and macrophages or embryonic fibroblasts (MEFs) from these mice were unable to respond to Il1 by production of Il6 (OMIM Ref. No. 147620), Tnf, or nitric oxide, or by activation of Nfkb or Jnk (OMIM Ref. No. 601158). Responses to Tnf, however, were intact, suggesting that the defect was specific for Il1. Analysis of responses to lipopolysaccharide (LPS), bacterial DNA (unmethylated CpG), peptidoglycan, or viral RNA extended the importance of Irak4 to Tlr4, Tlr9 (OMIM Ref. No. 605474), Tlr2 (OMIM Ref. No. 603028), and Tlr3 (OMIM Ref. No. 603029), respectively, which use signaling mechanisms similar to IL1R. Challenge of Irak4 $-/-$ mice with lymphocytic choriomeningitis virus showed reduced production of gamma-interferon (IFNG; 147570) by natural killer cells, but no loss of cytolytic function of these cells. Challenge with Staphylococcus aureus was lethal in all mutant mice but not in most wildtype mice. Luciferase reporter analysis suggested that Irak4 acts upstream of Myd88 and Mal (OMIM Ref. No. 606252) and downstream of Traf6. Animal model experiments lend further support to the function of IRAK4. By gene targeting, Suzuki et al. (2002) generated mice deficient in Irak4. Mutant mice and macrophages or embryonic fibroblasts (MEFs) from these

mice were unable to respond to Il1 by production of Il6 (OMIM Ref. No. 147620), Tnf, or nitric oxide, or by activation of Nfkb or Jnk (OMIM Ref. No. 601158). Responses to Tnf, however, were intact, suggesting that the defect was specific for Il1. Analysis of responses to lipopolysaccharide (LPS), bacterial DNA (unmethylated CpG), peptidoglycan, or viral RNA extended the importance of Irak4 to Tlr4, Tlr9 (OMIM Ref. No. 605474), Tlr2 (OMIM Ref. No. 603028), and Tlr3 (OMIM Ref. No. 603029), respectively, which use signaling mechanisms similar to IL1R. Challenge of Irak4 $-/-$ mice with lymphocytic choriomeningitis virus showed reduced production of gamma-interferon (IFNG; 147570) by natural killer cells, but no loss of cytolytic function of these cells. Challenge with *Staphylococcus aureus* was lethal in all mutant mice but not in most wildtype mice. Luciferase reporter analysis suggested that Irak4 acts upstream of Myd88 and Mal (OMIM Ref. No. 606252) and downstream of Traf6

[45836] It is appreciated that the abovementioned animal model for IRAK4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[45837] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[45838] Li, S.; Strelow, A.; Fontana, E. J.; Wesche, H. : IRAK-4: a novel member of the IRAK family with the properties of an IRAK-kinase. Proc. Nat. Acad. Sci. 99: 5567-5572, 2002. ; and

[45839] Scanlan, M. J.; Gordon, J. D.; Williamson, B.; Stockert, E.; Bander, N. H.; Jongeneel, V.; Gure, A. O.; Jager, D.; Jager, E.; Knuth, A.; Chen, Y.-T.; Old, L. J. : Antigens recognized b.

[45840] Further studies establishing the function and utilities of IRAK4 are found in John Hopkins OMIM database record ID 606883, and in cited publications numbered 6391-6394 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ20772

(Accession NM_017956) is another VGAM1291 host target gene. FLJ20772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20772 BINDING SITE, designated SEQ ID:19664, to the nucleotide sequence of VGAM1291

RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45841] Another function of VGAM1291 is therefore inhibition of FLJ20772 (Accession NM_017956). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20772. Vav 3 Oncogene (VAV3, Accession NM_006113) is another VGAM1291 host target gene. VAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:12758, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45842] Another function of VGAM1291 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM_006113). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. LOC150759 (Accession XM_086995) is another VGAM1291 host target gene. LOC150759 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150759 BINDING SITE, designated SEQ ID:39013, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45843] Another function of VGAM1291 is therefore inhibition of LOC150759 (Accession XM_086995). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150759. LOC151323 (Accession XM_087168) is another VGAM1291 host target gene. LOC151323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151323 BINDING SITE, designated SEQ ID:39102, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45844] Another function of VGAM1291 is therefore inhibition of LOC151323 (Accession XM_087168). Accordingly, utilities

of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151323. LOC200399 (Accession XM_114226) is another VGAM1291 host target gene. LOC200399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200399 BINDING SITE, designated SEQ ID:42810, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45845] Another function of VGAM1291 is therefore inhibition of LOC200399 (Accession XM_114226). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200399. LOC253955 (Accession XM_170486) is another VGAM1291 host target gene. LOC253955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253955 BINDING SITE, designated SEQ ID:45325, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45846] Another function of VGAM1291 is therefore inhibition of LOC253955 (Accession XM_170486). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253955. LOC91923 (Accession XM_041526) is another VGAM1291 host target gene. LOC91923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91923 BINDING SITE, designated SEQ ID:33543, to the nucleotide sequence of VGAM1291 RNA, herein designated VGAM RNA, also designated SEQ ID:4002.

[45847] Another function of VGAM1291 is therefore inhibition of LOC91923 (Accession XM_041526). Accordingly, utilities of VGAM1291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1292 (VGAM1292) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45848] VGAM1292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1292 was detected is described hereinabove with reference to Figs. 1–8.

[45849] VGAM1292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Swinepox Virus. VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45850] VGAM1292 gene encodes a VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1292 precursor RNA is designated SEQ ID:1278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1278 is located at position 74650 relative to the

genome of Swinepox Virus.

[45851] VGAM1292 precursor RNA folds onto itself, forming VGAM1292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45852] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1292 folded precursor RNA into VGAM1292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1292 RNA is designated SEQ ID:4003, and is provided hereinbelow with reference to the sequence listing part.

[45853] VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1292 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45854] VGAM1292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1292 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45855] The complementary binding of VGAM1292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1292 host target RNA into VGAM1292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45856] It is appreciated that VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1292 host target genes. The mRNA of each one of this plurality of VGAM1292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1292 RNA, herein designated VGAM RNA, and which when bound by VGAM1292 RNA causes inhibition of translation of respective one or more VGAM1292 host target proteins.

[45857] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1292 gene, herein designated VGAM GENE, on one or more VGAM1292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45858] It is yet further appreciated that a function of VGAM1292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1292 include diagnosis, prevention and treatment of viral infection by Swinepox Virus. Specific functions, and accordingly utilities, of VGAM1292 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1292 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45859] Nucleotide sequences of the VGAM1292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1292 are further described hereinbelow with reference to Table 1.

[45860] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1292 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45861] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1292 gene, herein designated VGAM is inhibition of expression of VGAM1292 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1292 correlate with, and may be deduced

from, the identity of the target genes which VGAM1292 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45862] G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776) is a VGAM1292 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16596, SEQ ID:27678 and SEQ ID:27691 respectively, to the nucleotide sequence of VGAM1292 RNA, herein designated VGAM RNA, also designated SEQ ID:4003.

[45863] A function of VGAM1292 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_014776). Accordingly, utilities of VGAM1292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. DRCTNNB1A (Accession NM_032581) is another VGAM1293 host target gene. DRCTNNB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by DRCTNNB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRCTNNB1A BINDING SITE, designated SEQ ID:26314, to the nucleotide sequence of VGAM1293 RNA, herein designated VGAM RNA, also designated SEQ ID:4004.

[45864] Another function of VGAM1293 is therefore inhibition of DRCTNNB1A (Accession NM_032581). Accordingly, utilities of VGAM1293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRCTNNB1A. HGC6.1.1 (Accession NM_014354) is another VGAM1293 host target gene. HGC6.1.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGC6.1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.1.1 BINDING SITE, designated SEQ ID:15682, to the nucleotide sequence of VGAM1293 RNA, herein designated VGAM RNA, also designated SEQ ID:4004.

[45865] Another function of VGAM1293 is therefore inhibition of HGC6.1.1 (Accession NM_014354). Accordingly, utilities of

VGAM1293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.1.1. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM1293 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16170, to the nucleotide sequence of VGAM1293 RNA, herein designated VGAM RNA, also designated SEQ ID:4004.

[45866] Another function of VGAM1293 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM1293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1294 (VGAM1294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host

target genes is known in the art.

[45867] VGAM1294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1294 was detected is described hereinabove with reference to Figs. 1–8.

[45868] VGAM1294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45869] VGAM1294 gene encodes a VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1294 precursor RNA is designated SEQ ID:1280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1280 is located at position 8120 relative to the genome of Vaccinia Virus.

[45870] VGAM1294 precursor RNA folds onto itself, forming VGAM1294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45871] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1294 folded precursor RNA into VGAM1294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1294 RNA is designated SEQ ID:4005, and is provided hereinbelow with reference to the sequence listing part.

[45872] VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1294 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45873] VGAM1294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1294 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45874] The complementary binding of VGAM1294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1294

host target RNA into VGAM1294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45875] It is appreciated that VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1294 host target genes. The mRNA of each one of this plurality of VGAM1294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1294 RNA, herein designated VGAM RNA, and which when bound by VGAM1294 RNA causes inhibition of translation of respective one or more VGAM1294 host target proteins.

[45876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1294 gene, herein designated VGAM GENE, on one or more VGAM1294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45877] It is yet further appreciated that a function of VGAM1294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1294 correlate with, and may be deduced from, the identity of the host target genes which VGAM1294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45878] Nucleotide sequences of the VGAM1294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1294 are further

described hereinbelow with reference to Table 1.

[45879] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1294 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45880] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1294 gene, herein designated VGAM is inhibition of expression of VGAM1294 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1294 correlate with, and may be deduced from, the identity of the target genes which VGAM1294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45881] ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM_001089) is a VGAM1294 host target gene. ABCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ABCA3 BINDING SITE, designated SEQ ID:6744, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45882] A function of VGAM1294 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM_001089), a gene which may be a transporter, may act as an efflux pump for chemotherapeutics drugs. Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA3. The function of ABCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM336. Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812) is another VGAM1294 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24197, to the nucleotide sequence of VGAM1294 RNA,

herein designated VGAM RNA, also designated SEQ ID:4005.

[45883] Another function of VGAM1294 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM_024812). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. CERD4 (Accession NM_012074) is another VGAM1294 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14343, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45884] Another function of VGAM1294 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM_006693) is another VGAM1294

host target gene. CPSF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CPSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF4 BINDING SITE, designated SEQ ID:13512, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45885] Another function of VGAM1294 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 4, 30kDa (CPSF4, Accession NM_006693), a gene which may bind DNA. Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF4. The function of CPSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM998.HYA22 (Accession NM_005808) is another VGAM1294 host target gene. HYA22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HYA22 BINDING SITE, designated SEQ ID:12385, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45886] Another function of VGAM1294 is therefore inhibition of HYA22 (Accession NM_005808). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYA22. KIAA1078 (Accession XM_036589) is another VGAM1294 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32472, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45887] Another function of VGAM1294 is therefore inhibition of KIAA1078 (Accession XM_036589). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1078. LOC145842 (Accession XM_085254) is another VGAM1294 host target gene. LOC145842 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145842 BINDING SITE, designated SEQ ID:37998, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45888] Another function of VGAM1294 is therefore inhibition of LOC145842 (Accession XM_085254). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145842. LOC203378 (Accession XM_117541) is another VGAM1294 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43561, to the nucleotide sequence of VGAM1294 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4005.

[45889] Another function of VGAM1294 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC253975 (Accession XM_171130) is another VGAM1294 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45937, to the nucleotide sequence of VGAM1294 RNA, herein designated VGAM RNA, also designated SEQ ID:4005.

[45890] Another function of VGAM1294 is therefore inhibition of LOC253975 (Accession XM_171130). Accordingly, utilities of VGAM1294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1295 (VGAM1295) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45891] VGAM1295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1295 was detected is described hereinabove with reference to Figs. 1–8.

[45892] VGAM1295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45893] VGAM1295 gene encodes a VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1295 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1295 precursor RNA is designated SEQ ID:1281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1281 is located at position 10613 relative to the genome of Vaccinia Virus.

[45894] VGAM1295 precursor RNA folds onto itself, forming

VGAM1295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45895] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1295 folded precursor RNA into VGAM1295 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1295 RNA is designated SEQ ID:4006, and is provided hereinbelow with reference to the sequence listing part.

[45896] VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1295 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45897] VGAM1295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1295 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45898] The complementary binding of VGAM1295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1295 host target RNA into VGAM1295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45899] It is appreciated that VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1295 host target genes. The mRNA of each one of this plurality of VGAM1295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1295 RNA, herein designated VGAM RNA, and which when bound by VGAM1295 RNA causes inhibition of translation of respective one or more VGAM1295 host target proteins.

[45900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1295 gene, herein designated VGAM GENE, on one or more VGAM1295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45901] It is yet further appreciated that a function of VGAM1295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1295 correlate with, and may be deduced from, the identity of the host target genes which VGAM1295 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[45902] Nucleotide sequences of the VGAM1295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1295 are further described hereinbelow with reference to Table 1.

[45903] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1295 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45904] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1295 gene, herein designated VGAM is inhibition of expression of VGAM1295 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1295 correlate with, and may be deduced from, the identity of the target genes which VGAM1295 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[45905] Centrosomal Protein 1 (CEP1, Accession NM_007018) is a VGAM1295 host target gene. CEP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CEP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEP1 BINDING SITE, designated SEQ ID:13874, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45906] A function of VGAM1295 is therefore inhibition of Centrosomal Protein 1 (CEP1, Accession NM_007018), a gene which mediates actin cytoskeleton reorganization at the plasma membrane. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEP1. The function of CEP1 has been established by previous studies.

Hemonectin is an extracellular matrix cytoadhesive protein that promotes the attachment of developing bone marrow granulocytic cells to bone marrow stroma. By immunoscreening an endothelial cell cDNA library with a polyclonal anti-rabbit hemonectin antibody and probing

an oligo(dT)–primed library, Bahou et al. (1992) obtained a cDNA encoding MSE55. Sequence analysis predicted that the 391–amino acid serum protein lacks a signal peptide but contains a series of 8 proline/alanine repeats as well as EF–hand motifs. Southern blot analysis suggested that the MSE55 gene is conserved in primates, dogs, and ducks. Northern blot analysis detected a 2.5–kb MSE55 transcript in endothelial and K562 cells; expression was not detected in monocytic, myeloid, erythroleukemic, or lymphocytic cell lines. Immunoblot analysis showed expression of a 55–kD protein in endothelial cell lines and serum. Because antibody raised against MSE55 did not recognize hemonectin and anti–hemonectin antibody did not react with the recombinant protein, Bahou et al.

(1992) concluded that hemonectin and MSE55 are distinct.

Burbelo et al. (1995) identified a 16–amino acid CDC42 (OMIM Ref. No. 116952)/RAC (OMIM Ref. No. 602048) interactive–binding (CRIB) region in a number of kinase and nonkinase proteins, including MSE55. MSE55, a nonkinase, bound more strongly to the GTP form of CDC42 than to RAC. Burbelo et al. (1999) showed that MSE55 increases membrane actin polymerization and induces the formation of long, actin–based protrusions in fibroblasts.

They concluded that MSE55 is a CDC42 effector protein that mediates actin cytoskeleton reorganization at the plasma membrane.

[45907] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45908] Burbelo, P. D.; Drechsel, D.; Hall, A. : A conserved binding motif defines numerous candidate target proteins for both Cdc42 and Rac GTPases. J. Biol. Chem. 270: 29071–29074, 1995. ; and

[45909] Burbelo, P. D.; Snow, D. M.; Bahou, W.; Spiegel, S. : MSE55, a Cdc42 effector protein, induces long cellular extensions in fibroblasts. Proc. Nat. Acad. Sci. 96: 9083–9088, 1999.

[45910] Further studies establishing the function and utilities of CEP1 are found in John Hopkins OMIM database record ID 606084, and in cited publications numbered 4425–442 and 4908 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP–N–acetyl–alpha–D–galactosamine:polypeptide N–acetylgalactosaminyltransferase 7 (GalNAc–T7) (GALNT7, Accession NM_017423) is another VGAM1295 host target gene. GALNT7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by GALNT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT7 BINDING SITE, designated SEQ ID:18879, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45911] Another function of VGAM1295 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 7 (GalNAc-T7) (GALNT7, Accession NM_017423). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT7. Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165) is another VGAM1295 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5676, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ

ID:4006.

[45912] Another function of VGAM1295 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM341. Phosphomannomutase 2 (PMM2, Accession XM_050755) is another VGAM1295 host target gene.

PMM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMM2 BINDING SITE, designated SEQ

ID:35676, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ

ID:4006.

[45913] Another function of VGAM1295 is therefore inhibition of

Phosphomannomutase 2 (PMM2, Accession XM_050755). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMM2. RalA Binding Protein 1 (RALBP1, Accession NM_006788) is another VGAM1295 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13655, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45914] Another function of VGAM1295 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM345. Ubiquilin 1 (UBQLN1, Accession NM_013438) is another VGAM1295 host target gene. UBQLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBQLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBQLN1 BINDING SITE, designated SEQ ID:15100, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45915] Another function of VGAM1295 is therefore inhibition of Ubiquilin 1 (UBQLN1, Accession NM_013438), a gene which may have a role in regulating cell cycle progression. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBQLN1. The function of UBQLN1 has been established by previous studies. By screening a human nigra cDNA library with a rat DA41 cDNA as a probe, Hanaoka et al. (2000) isolated the human DA41 homolog. Human DA41 encodes a 589-amino acid protein with a predicted molecular mass of 62.4 kD. The protein shows 86% amino acid sequence identity with the rat pro-

tein, indicating the evolutionarily conserved structure and function of DA41. DA41 was expressed ubiquitously in adult human tissues, with relatively higher levels in pituitary gland, adrenal gland, kidney, thymus, and placenta. By performing independent yeast 2-hybrid screens, Kleijnen et al. (2000) isolated cDNAs encoding PLIC1 and PLIC2 (UBQLN2; 300264), homologs of the mouse Plics (proteins linking integrin-associated protein (IAP; 601028) and cytoskeleton) and the yeast Dsk2 protein. PLIC1, also called UBQLN1, shares 72% amino acid identity with PLIC2. Two motifs are conserved in the mammalian PLICs and yeast Dsk2, an N-terminal ubiquitin (OMIM Ref. No. 191320)-like (UBL) domain and a C-terminal ubiquitin-associated (UBA) domain. Unlike ubiquitin, the UBL domain of the PLICs does not have a diglycine motif in its C terminus; the diglycine motif serves as a target site for cellular hydrolases that release ubiquitin from precursor fusion proteins. The absence of a GG sequence suggests that the UBL domain in the PLICs is an integral part of the open reading frame. The UBA domain is a loosely defined sequence motif present in multiple enzyme classes of the ubiquitination machinery. The most notable difference between the mammalian PLICs is the presence of a colla-

gen-like motif in PLIC2 that is absent in PLIC1 and yeast Dsk2. This domain is most homologous to the collagen-like oncoprotein of herpesvirus Saimiri, STP-C488, which is implicated in intracellular signaling via the RAS-RAF pathway (see OMIM Ref. No. 190020). The collagen-like domain of PLIC2 contains 8 PXGP motifs that are susceptible to cleavage by collagenase in vitro. Kleijnen et al (2000) showed that the human PLICs physically associate with both proteasomes and ubiquitin ligases in large complexes. Overexpression of PLICs interfered with the in vivo degradation of 2 unrelated ubiquitin-dependent proteasome substrates, p53 (OMIM Ref. No. 191170) and I-kappa-B-alpha (NFKBIA; 164008), but not a ubiquitin-independent substrate. These findings raised the possibility that the PLICs, and possibly related ubiquitin-like family members, may functionally link the ubiquitination machinery to the proteasome to affect in vivo protein degradation.

[45916] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

S. : Molecular cloning and expression analysis of the human DA41 gene and its mapping to chromosome

9q21.2–q21.3. J. Hum. Genet. 45: 188–191, 2000. ; and

[45918] Kleijnen, M. F.; Shih, A. H.; Zhou, P.; Kumar, S.; Soccio, R. E.; Kedersha, N. L.; Gill, G.; Howley, P. M. : The hPLIC proteins may provide a link between the ubiquitination machinery.

[45919] Further studies establishing the function and utilities of UBQLN1 are found in John Hopkins OMIM database record ID 605046, and in cited publications numbered 659 and 10635 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquilin 2 (UBQLN2, Accession NM_013444) is another VGAM1295 host target gene. UBQLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBQLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBQLN2 BINDING SITE, designated SEQ ID:15111, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45920] Another function of VGAM1295 is therefore inhibition of

Ubiquilin 2 (UBQLN2, Accession NM_013444), a gene which is involved in spindle pole body duplication with rad23. Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBQLN2. The function of UBQLN2 has been established by previous studies. By performing independent yeast 2-hybrid screens, Kleijnen et al. (2000) isolated cDNAs encoding PLIC1 (UBQLN1; 605046) and PLIC2, homologs of the mouse Plics (proteins linking integrin-associated protein (IAP; 601028) and cytoskeleton) and the yeast Dsk2 protein. The predicted 624-amino acid PLIC2 protein, also called UBQLN2, shares 72% amino acid identity with PLIC1. Two motifs are conserved in the mammalian PLICs and yeast Dsk2, an N-terminal ubiquitin (OMIM Ref. No. 191320)-like (UBL) domain and a C-terminal ubiquitin-associated (UBA) domain. Unlike ubiquitin, the UBL domain of the PLICs does not have a diglycine motif in its C terminus; the diglycine motif serves as a target site for cellular hydrolases that release ubiquitin from precursor fusion proteins. The absence of a GG sequence suggests that the UBL domain in the PLICs is an integral part of the open reading frame. The UBA domain is a loosely defined sequence motif

present in multiple enzyme classes of the ubiquitination machinery. The most notable difference between the mammalian PLICs is the presence of a collagen-like motif in PLIC2 that is absent in PLIC1 and yeast Dsk2. This domain is most homologous to the collagen-like oncoprotein of herpesvirus Saimiri, STP-C488, which is implicated in intracellular signaling via the RAS-RAF pathway (see OMIM Ref. No. 190020). The collagen-like domain of PLIC2 contains 8 PXGP motifs that are susceptible to cleavage by collagenase in vitro. Kleijnen et al (2000) showed that the human PLICs physically associate with both proteasomes and ubiquitin ligases in large complexes. Overexpression of PLICs interfered with the in vivo degradation of 2 unrelated ubiquitin-dependent proteasome substrates, p53 (OMIM Ref. No. 191170) and I-kappa-B-alpha (NFKBIA; 164008), but not a ubiquitin-independent substrate. These findings raised the possibility that the PLICs, and possibly related ubiquitin-like family members, may functionally link the ubiquitination machinery to the proteasome to affect in vivo protein degradation. By screening a human lung 2-hybrid cDNA library using a pGBT9-STCH (OMIM Ref. No. 601100) plasmid as bait, Kaye et al. (2000) isolated a cDNA encoding UBQLN2,

which they termed CHAP1/DSK2. Mutation analysis determined that the C-terminal Sti1-like repeat sequence, but neither the N-terminal UBL domain nor the C-terminal UBA domain, is required for binding of UBQLN2 to the ATPase domain of STCH.

[45921] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45922] Kaye, F. J.; Shows, T. B. : Assignment of ubiquilin 2 (UBQLN2) to human chromosome xp11.23-p11.1 by GeneBridge radiation hybrids. Cytogenet. Cell Genet. 89: 116-117, 2000. ; and

[45923] Kleijnen, M. F.; Shih, A. H.; Zhou, P.; Kumar, S.; Soccio, R. E.; Kedersha, N. L.; Gill, G.; Howley, P. M. : The hPLIC proteins may provide a link between the ubiquitination machinery.

[45924] Further studies establishing the function and utilities of UBQLN2 are found in John Hopkins OMIM database record ID 300264, and in cited publications numbered 10633-10635 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916) is another VGAM1295

host target gene. AP1S2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1S2 BINDING SITE, designated SEQ ID:10001, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45925] Another function of VGAM1295 is therefore inhibition of Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S2. Claudin 1 (CLDN1, Accession NM_021101) is another VGAM1295 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22080, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA,

also designated SEQ ID:4006.

[45926] Another function of VGAM1295 is therefore inhibition of Claudin 1 (CLDN1, Accession NM_021101). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. dA141H5.1 (Accession NM_145234) is another VGAM1295 host target gene. dA141H5.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by dA141H5.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of dA141H5.1 BINDING SITE, designated SEQ ID:29747, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45927] Another function of VGAM1295 is therefore inhibition of dA141H5.1 (Accession NM_145234). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with dA141H5.1. FHX (Accession NM_018416) is another VGAM1295 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20460, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45928] Another function of VGAM1295 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ20254 (Accession NM_017727) is another VGAM1295 host target gene. FLJ20254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20254 BINDING SITE, designated SEQ ID:19315, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45929] Another function of VGAM1295 is therefore inhibition of FLJ20254 (Accession NM_017727). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20254. FLJ22690 (Accession NM_024711) is another VGAM1295 host target gene. FLJ22690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22690 BINDING SITE, designated SEQ ID:24036, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45930] Another function of VGAM1295 is therefore inhibition of FLJ22690 (Accession NM_024711). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22690. Ganglioside-induced Differentiation-associated Protein 1-like 1 (GDAP1L1, Accession NM_024034) is another VGAM1295 host target gene. GDAP1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDAP1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GDAP1L1 BINDING SITE, designated SEQ ID:23465, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45931] Another function of VGAM1295 is therefore inhibition of Ganglioside-induced Differentiation-associated Protein 1-like 1 (GDAP1L1, Accession NM_024034). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDAP1L1. Glia Maturation Factor, Beta (GMFB, Accession NM_004124) is another VGAM1295 host target gene. GMFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GMFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:10330, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45932] Another function of VGAM1295 is therefore inhibition of Glia Maturation Factor, Beta (GMFB, Accession NM_004124). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB. KIAA0254 (Accession

NM_014758) is another VGAM1295 host target gene. KIAA0254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0254 BINDING SITE, designated SEQ ID:16502, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45933] Another function of VGAM1295 is therefore inhibition of KIAA0254 (Accession NM_014758). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0254. KIAA1524 (Accession XM_056015) is another VGAM1295 host target gene. KIAA1524 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1524 BINDING SITE, designated SEQ ID:36359, to the nucleotide sequence of VGAM1295 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4006.

[45934] Another function of VGAM1295 is therefore inhibition of KIAA1524 (Accession XM_056015). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1524. MGC13007 (Accession NM_032320) is another VGAM1295 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING SITE, designated SEQ ID:26119, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45935] Another function of VGAM1295 is therefore inhibition of MGC13007 (Accession NM_032320). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. Phytoceramidase, Alkaline (PHCA, Accession NM_018367) is another VGAM1295 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHCA,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20378, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45936] Another function of VGAM1295 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM_018367). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. PRO1580 (Accession NM_018502) is another VGAM1295 host target gene. PRO1580 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1580 BINDING SITE, designated SEQ ID:20565, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45937] Another function of VGAM1295 is therefore inhibition of PRO1580 (Accession NM_018502). Accordingly, utilities of

VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1580. LOC126661 (Accession XM_059061) is another VGAM1295 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36855, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45938] Another function of VGAM1295 is therefore inhibition of LOC126661 (Accession XM_059061). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC158364 (Accession XM_088546) is another VGAM1295 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158364 BINDING SITE, designated SEQ ID:39813, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45939] Another function of VGAM1295 is therefore inhibition of LOC158364 (Accession XM_088546). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. LOC197319 (Accession XM_113862) is another VGAM1295 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42475, to the nucleotide sequence of VGAM1295 RNA, herein designated VGAM RNA, also designated SEQ ID:4006.

[45940] Another function of VGAM1295 is therefore inhibition of LOC197319 (Accession XM_113862). Accordingly, utilities of VGAM1295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1296 (VGAM1296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45941] VGAM1296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1296 was detected is described hereinabove with reference to Figs. 1–8.

[45942] VGAM1296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45943] VGAM1296 gene encodes a VGAM1296 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1296 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1296 precursor RNA is designated SEQ ID:1282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1282 is located at position 11590 relative to the

genome of Vaccinia Virus.

[45944] VGAM1296 precursor RNA folds onto itself, forming VGAM1296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45945] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1296 folded precursor RNA into VGAM1296 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1296 RNA is designated SEQ ID:4007, and is provided hereinbelow with reference to the sequence listing part.

[45946] VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1296 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45947] VGAM1296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1296 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[45948] The complementary binding of VGAM1296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1296 host target RNA into VGAM1296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45949] It is appreciated that VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1296 host target genes. The mRNA of each one of this plurality of VGAM1296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1296 RNA, herein designated VGAM RNA, and which when bound by VGAM1296 RNA causes inhibition of translation of respective one or more VGAM1296 host target proteins.

[45950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1296 gene, herein designated VGAM GENE, on one or more VGAM1296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45951] It is yet further appreciated that a function of VGAM1296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1296 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1296 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45952] Nucleotide sequences of the VGAM1296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1296 are further described hereinbelow with reference to Table 1.

[45953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1296 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45954] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1296 gene, herein designated VGAM is inhibition of expression of VGAM1296 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1296 correlate with, and may be deduced

from, the identity of the target genes which VGAM1296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45955] B-cell Translocation Gene 1, Anti-proliferative (BTG1, Accession NM_001731) is a VGAM1296 host target gene. BTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG1 BINDING SITE, designated SEQ ID:7465, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45956] A function of VGAM1296 is therefore inhibition of B-cell Translocation Gene 1, Anti-proliferative (BTG1, Accession NM_001731), a gene which is a member of a new family of antiproliferative proteins. Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG1. The function of BTG1 has been established by previous studies. Rimokh et al. (1991) cloned the breakpoint of a t(8;12) chromosomal translocation in a case of B-cell chronic lymphocytic leukemia and isolated a coding se-

quence mapping on 12q22. This sequence detected a 1.8-kb transcript in virtually all tissues tested except in the brain and muscle where the signal was barely detectable. The putative gene corresponding to this sequence, termed BTG1 for B-cell translocation gene 1, was shown to be highly conserved in evolution; a similar 1.8-kb transcript could be detected in murine and chicken tissue by using a human BTG1 DNA probe. Rouault et al. (1992) established the genomic organization of the gene. The full-length cDNA isolated from a lymphoblastoid cell line contained an open reading frame of 171 amino acids. BTG1 expression was maximal in the G0/G1 phases of the cell cycle and downregulated when cells progressed throughout G1. Furthermore, transfection experiments using NIH 3T3 cells indicated that BTG1 negatively regulates cell proliferation. Rouault et al. (1992) postulated that BTG1 is a member of a new family of antiproliferative genes

[45957] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[45958] Rouault, J.-P.; Rimokh, R.; Tessa, C.; Paranhos, G.; Ffrench, M.; Duret, L.; Garoccio, M.; Germain, D.; Samarut,

J.; Magaud, J.-P. : BTG1, a member of a new family of anti-proliferative genes. EMBO J. 11: 1663–1670, 1992. ; and

[45959] Rimokh, R.; Rouault, J. P.; Wahbi, K.; Gadoux, M.; Lafage, M.; Archimbaud, E.; Charrin, C.; Gentilhomme, O.; Germain, D.; Samarut, J.; Magaud, J. P. : A chromosome 12 coding region is ju.

[45960] Further studies establishing the function and utilities of BTG1 are found in John Hopkins OMIM database record ID 109580, and in cited publications numbered 138 and 1445 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BH-protocadherin (brain-heart) (PCDH7, Accession NM_002589) is another VGAM1296 host target gene. PCDH7 BINDING SITE1 through PCDH7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH7 BINDING SITE1 through PCDH7 BINDING SITE3, designated SEQ ID:8452, SEQ ID:26217 and SEQ ID:26220 respectively, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45961] Another function of VGAM1296 is therefore inhibition of BH-protocadherin (brain-heart) (PCDH7, Accession NM_002589). Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH7. KIAA1950 (Accession XM_166532) is another VGAM1296 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44484, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45962] Another function of VGAM1296 is therefore inhibition of KIAA1950 (Accession XM_166532). Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MAC30 (Accession XM_031536) is another VGAM1296 host target gene. MAC30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAC30, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAC30 BINDING SITE, designated SEQ ID:31407, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45963] Another function of VGAM1296 is therefore inhibition of MAC30 (Accession XM_031536). Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAC30. LOC147219 (Accession XM_097214) is another VGAM1296 host target gene. LOC147219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147219 BINDING SITE, designated SEQ ID:40823, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45964] Another function of VGAM1296 is therefore inhibition of LOC147219 (Accession XM_097214). Accordingly, utilities of VGAM1296 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC147219. LOC150174 (Accession XM_086802) is another VGAM1296 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150174 BINDING SITE, designated SEQ ID:38867, to the nucleotide sequence of VGAM1296 RNA, herein designated VGAM RNA, also designated SEQ ID:4007.

[45965] Another function of VGAM1296 is therefore inhibition of LOC150174 (Accession XM_086802). Accordingly, utilities of VGAM1296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1297 (VGAM1297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45966] VGAM1297 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1297 was detected is described hereinabove with reference to Figs. 1–8.

[45967] VGAM1297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45968] VGAM1297 gene encodes a VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1297 precursor RNA is designated SEQ ID:1283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1283 is located at position 75507 relative to the genome of Yaba-like Disease Virus.

[45969] VGAM1297 precursor RNA folds onto itself, forming VGAM1297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[45970] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1297 folded precursor RNA into VGAM1297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1297 RNA is designated SEQ ID:4008, and is provided hereinbelow with reference to the sequence listing part.

[45971] VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1297 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45972] VGAM1297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1297 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45973] The complementary binding of VGAM1297 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1297 host target RNA into VGAM1297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45974] It is appreciated that VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1297 host target genes. The mRNA of each one of this plurality of VGAM1297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1297 RNA, herein designated VGAM RNA, and which when bound by VGAM1297 RNA causes inhibition of translation of respective one or more VGAM1297 host target proteins.

[45975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1297 gene, herein designated VGAM GENE, on one or more VGAM1297 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[45976] It is yet further appreciated that a function of VGAM1297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1297 correlate with, and may be deduced from, the identity of the host target genes which VGAM1297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[45977] Nucleotide sequences of the VGAM1297 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1297 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1297 are further described hereinbelow with reference to Table 1.

[45978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1297 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1297 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[45979] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1297 gene, herein designated VGAM is inhibition of expression of VGAM1297 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1297 correlate with, and may be deduced from, the identity of the target genes which VGAM1297 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[45980] Reserved (C8orf6, Accession XM_114624) is a VGAM1297 host target gene. C8orf6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by C8orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf6 BINDING SITE, designated SEQ ID:43004, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45981] A function of VGAM1297 is therefore inhibition of Reserved (C8orf6, Accession XM_114624). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf6. FLJ10193 (Accession NM_018019) is another VGAM1297 host target gene. FLJ10193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10193 BINDING SITE, designated SEQ ID:19760, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45982] Another function of VGAM1297 is therefore inhibition of FLJ10193 (Accession NM_018019). Accordingly, utilities of

VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10193. FLJ30532 (Accession NM_144724) is another VGAM1297 host target gene. FLJ30532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:29548, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45983] Another function of VGAM1297 is therefore inhibition of FLJ30532 (Accession NM_144724). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532. KIAA0537 (Accession NM_014840) is another VGAM1297 host target gene. KIAA0537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0537 BINDING SITE, designated SEQ ID:16863, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45984] Another function of VGAM1297 is therefore inhibition of KIAA0537 (Accession NM_014840). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. KIAA0596 (Accession XM_031706) is another VGAM1297 host target gene. KIAA0596 BINDING SITE1 and KIAA0596 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA0596, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0596 BINDING SITE1 and KIAA0596 BINDING SITE2, designated SEQ ID:31466 and SEQ ID:31464 respectively, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45985] Another function of VGAM1297 is therefore inhibition of KIAA0596 (Accession XM_031706). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0596. KIAA1766 (Accession XM_049218) is another VGAM1297 host target gene. KIAA1766 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1766 BINDING SITE, designated SEQ ID:35353, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45986] Another function of VGAM1297 is therefore inhibition of KIAA1766 (Accession XM_049218). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1766. LAGY (Accession NM_139212) is another VGAM1297 host target gene. LAGY BINDING SITE1 through LAGY BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LAGY, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAGY BINDING SITE1 through LAGY BINDING SITE3, designated SEQ ID:29234, SEQ ID:26246 and SEQ

ID:29232 respectively, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45987] Another function of VGAM1297 is therefore inhibition of LAGY (Accession NM_139212). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAGY. LOC124152 (Accession XM_058777) is another VGAM1297 host target gene. LOC124152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124152 BINDING SITE, designated SEQ ID:36737, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45988] Another function of VGAM1297 is therefore inhibition of LOC124152 (Accession XM_058777). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124152. LOC158835 (Accession XM_088683) is another VGAM1297 host target gene. LOC158835 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158835 BINDING SITE, designated SEQ ID:39895, to the nucleotide sequence of VGAM1297 RNA, herein designated VGAM RNA, also designated SEQ ID:4008.

[45989] Another function of VGAM1297 is therefore inhibition of LOC158835 (Accession XM_088683). Accordingly, utilities of VGAM1297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158835. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1298 (VGAM1298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[45990] VGAM1298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1298 was detected is described hereinabove with reference to Figs. 1-8.

[45991] VGAM1298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[45992] VGAM1298 gene encodes a VGAM1298 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1298 precursor RNA is designated SEQ ID:1284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1284 is located at position 77434 relative to the genome of Yaba-like Disease Virus.

[45993] VGAM1298 precursor RNA folds onto itself, forming VGAM1298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[45994] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1298 folded precursor RNA into VGAM1298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1298 RNA is designated SEQ ID:4009, and is provided hereinbelow with reference to the sequence listing part.

[45995] VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1298 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[45996] VGAM1298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1298 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1298 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[45997] The complementary binding of VGAM1298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1298 host target RNA into VGAM1298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[45998] It is appreciated that VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1298 host target genes. The mRNA of each one of this plurality of VGAM1298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1298 RNA, herein designated VGAM RNA, and which when bound by VGAM1298 RNA causes inhibition of translation of respective one or more VGAM1298 host target proteins.

[45999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1298 gene, herein designated VGAM GENE, on one or more VGAM1298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46000] It is yet further appreciated that a function of VGAM1298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1298 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1298 correlate with, and may be deduced from, the identity of the host target genes which VGAM1298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46001] Nucleotide sequences of the VGAM1298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1298 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1298 are further described hereinbelow with reference to Table 1.

[46002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1298 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46003] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1298 gene, herein designated VGAM is inhibition of expression of VGAM1298 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1298 correlate with, and may be deduced from, the identity of the target genes which VGAM1298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46004] LOC158014 (Accession XM_088442) is a VGAM1298 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39689, to the nucleotide sequence of VGAM1298 RNA, herein designated VGAM RNA, also designated SEQ ID:4009.

[46005] A function of VGAM1298 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM1298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1299 (VGAM1299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46006] VGAM1299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1299 was detected is described hereinabove with reference to Figs. 1–8.

[46007] VGAM1299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[46008] VGAM1299 gene encodes a VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1299 precursor RNA is designated SEQ ID:1285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1285 is located at position 80251 relative to the genome of Yaba-like Disease Virus.

[46009] VGAM1299 precursor RNA folds onto itself, forming VGAM1299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46010] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1299 folded precursor RNA into VGAM1299 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1299 RNA is designated SEQ ID:4010, and is provided hereinbelow with reference to the sequence listing part.

[46011] VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1299 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46012] VGAM1299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1299 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46013] The complementary binding of VGAM1299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1299 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1299 host target RNA into VGAM1299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46014] It is appreciated that VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1299 host target genes. The mRNA of each one of this plurality of VGAM1299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1299 RNA, herein designated VGAM RNA, and which when bound by VGAM1299 RNA causes inhibition of translation of respective one or more VGAM1299 host target proteins.

[46015] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1299 gene, herein designated VGAM GENE, on one or more VGAM1299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46016] It is yet further appreciated that a function of VGAM1299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1299 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1299 correlate with, and may be deduced from, the identity of the host target genes which VGAM1299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46017] Nucleotide sequences of the VGAM1299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1299 are further described hereinbelow with reference to Table 1.

[46018] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1299 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46019] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1299 gene, herein designated VGAM is inhibition of expression of VGAM1299 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1299 correlate with, and may be deduced from, the identity of the target genes which VGAM1299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46020] POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237) is a VGAM1299 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12898, to the nucleotide sequence of VGAM1299 RNA, herein designated VGAM RNA, also designated SEQ

ID:4010.

[46021] A function of VGAM1299 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM1299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1300 (VGAM1300) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46022] VGAM1300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1300 was detected is described hereinabove with reference to Figs. 1-8.

[46023] VGAM1300 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Yaba-like Disease Virus. VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46024] VGAM1300 gene encodes a VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1300 precursor RNA is designated SEQ ID:1286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1286 is located at position 78499 relative to the genome of Yaba-like Disease Virus.

[46025] VGAM1300 precursor RNA folds onto itself, forming VGAM1300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46026] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1300 folded precursor RNA into VGAM1300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1300 RNA is designated SEQ ID:4011, and is provided hereinbelow with reference to the sequence listing part.

[46027] VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1300 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46028] VGAM1300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1300 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46029] The complementary binding of VGAM1300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1300

host target RNA into VGAM1300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46030] It is appreciated that VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1300 host target genes. The mRNA of each one of this plurality of VGAM1300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1300 RNA, herein designated VGAM RNA, and which when bound by VGAM1300 RNA causes inhibition of translation of respective one or more VGAM1300 host target proteins.

[46031] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1300 gene, herein designated VGAM GENE, on one or more VGAM1300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46032] It is yet further appreciated that a function of VGAM1300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1300 correlate with, and may be deduced from, the identity of the host target genes which VGAM1300 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46033] Nucleotide sequences of the VGAM1300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1300 are further

described hereinbelow with reference to Table 1.

[46034] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1300 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46035] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1300 gene, herein designated VGAM is inhibition of expression of VGAM1300 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1300 correlate with, and may be deduced from, the identity of the target genes which VGAM1300 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46036] Mab-21-like 1 (C. elegans) (MAB21L1, Accession NM_005584) is a VGAM1300 host target gene. MAB21L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAB21L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MAB21L1 BINDING SITE, designated SEQ ID:12110, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46037] A function of VGAM1300 is therefore inhibition of Mab-21-like 1 (*C. elegans*) (MAB21L1, Accession NM_005584), a gene which may control cerebellum and eye development; very strongly similar to murine Mm.10798. Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L1. The function of MAB21L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Spastic Paraplegia 3A (autosomal dominant) (SPG3A, Accession NM_015915) is another VGAM1300 host target gene. SPG3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPG3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPG3A BINDING SITE, designated SEQ ID:18046, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA,

also designated SEQ ID:4011.

[46038] Another function of VGAM1300 is therefore inhibition of Spastic Paraplegia 3A (autosomal dominant) (SPG3A, Accession NM_015915). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPG3A. C6orf5 (Accession NM_015524) is another VGAM1300 host target gene. C6orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf5 BINDING SITE, designated SEQ ID:17783, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46039] Another function of VGAM1300 is therefore inhibition of C6orf5 (Accession NM_015524). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf5. DKFZP586M0622 (Accession NM_015583) is another VGAM1300 host target gene. DKFZP586M0622 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by DKFZP586M0622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586M0622 BINDING SITE, designated SEQ ID:17849, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46040] Another function of VGAM1300 is therefore inhibition of DKFZP586M0622 (Accession NM_015583). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586M0622. FLJ14281 (Accession NM_024920) is another VGAM1300 host target gene. FLJ14281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14281 BINDING SITE, designated SEQ ID:24450, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46041] Another function of VGAM1300 is therefore inhibition of

FLJ14281 (Accession NM_024920). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14281. KIAA1789 (Accession XM_040486) is another VGAM1300 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:33315, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46042] Another function of VGAM1300 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1789. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM1300 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21902, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46043] Another function of VGAM1300 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. Regulator of G-protein Signalling 13 (RGS13, Accession NM_144766) is another VGAM1300 host target gene. RGS13 BINDING SITE1 and RGS13 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RGS13, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS13 BINDING SITE1 and RGS13 BINDING SITE2, designated SEQ ID:29557 and SEQ ID:8831 respectively, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46044] Another function of VGAM1300 is therefore inhibition of

Regulator of G-protein Signalling 13 (RGS13, Accession NM_144766). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS13. LOC51134 (Accession NM_016122) is another VGAM1300 host target gene. LOC51134 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51134 BINDING SITE, designated SEQ ID:18208, to the nucleotide sequence of VGAM1300 RNA, herein designated VGAM RNA, also designated SEQ ID:4011.

[46045] Another function of VGAM1300 is therefore inhibition of LOC51134 (Accession NM_016122). Accordingly, utilities of VGAM1300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1301 (VGAM1301) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[46046] VGAM1301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1301 was detected is described hereinabove with reference to Figs. 1-8.

[46047] VGAM1301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Yaba-like Disease Virus. VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46048] VGAM1301 gene encodes a VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1301 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1301 precursor RNA is designated SEQ ID:1287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1287 is located at position 78643 relative to the genome of Yaba-like Disease Virus.

[46049] VGAM1301 precursor RNA folds onto itself, forming VGAM1301 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46050] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1301 folded precursor RNA into VGAM1301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM1301 RNA is designated SEQ ID:4012, and is provided hereinbelow with reference to the sequence listing part.

[46051] VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1301 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46052] VGAM1301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1301 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46053] The complementary binding of VGAM1301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1301 host target RNA into VGAM1301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46054] It is appreciated that VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1301 host target genes. The mRNA of each one of this plurality of VGAM1301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1301 RNA, herein designated VGAM RNA, and which when bound by VGAM1301 RNA causes inhibition of translation of respective one or more VGAM1301 host target proteins.

[46055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1301 gene, herein designated VGAM GENE, on one or more VGAM1301 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46056] It is yet further appreciated that a function of VGAM1301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1301 include diagnosis, prevention and treatment of viral infection by Yaba-like Disease Virus. Specific functions, and accordingly utilities, of VGAM1301 correlate with, and may be deduced from, the identity of the host target genes which VGAM1301 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[46057] Nucleotide sequences of the VGAM1301 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1301 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1301 are further described hereinbelow with reference to Table 1.

[46058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1301 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1301 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46059] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1301 gene, herein designated VGAM is inhibition of expression of VGAM1301 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1301 correlate with, and may be deduced from, the identity of the target genes which VGAM1301 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46060] STAF65(gamma) (Accession NM_014860) is a VGAM1301 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16925, to the nucleotide sequence of VGAM1301 RNA, herein designated VGAM RNA, also designated SEQ ID:4012.

[46061] A function of VGAM1301 is therefore inhibition of STAF65(gamma) (Accession NM_014860). Accordingly, utilities of VGAM1301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1302 (VGAM1302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46062] VGAM1302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1302 was detected is described hereinabove with reference to Figs. 1–8.

[46063] VGAM1302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46064] VGAM1302 gene encodes a VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1302 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1302 precursor RNA is designated SEQ ID:1288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1288 is located at position 180181 relative to the genome of Human Herpesvirus 5.

[46065] VGAM1302 precursor RNA folds onto itself, forming VGAM1302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46066] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1302 folded precursor RNA into VGAM1302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1302 RNA is designated SEQ ID:4013, and is provided hereinbelow with reference to the sequence listing part.

[46067] VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1302 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46068] VGAM1302 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1302 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[46069] The complementary binding of VGAM1302 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1302 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1302 host target RNA into VGAM1302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46070] It is appreciated that VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1302 host target genes. The mRNA of each one of this plurality of VGAM1302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1302 RNA, herein designated VGAM RNA, and which when bound by VGAM1302 RNA causes inhibition of translation of respective one or more VGAM1302 host target proteins.

[46071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1302 gene, herein designated VGAM GENE, on one or more VGAM1302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46072] It is yet further appreciated that a function of VGAM1302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1302 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1302 correlate with, and may be deduced from, the identity of the host target genes which VGAM1302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46073] Nucleotide sequences of the VGAM1302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1302 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1302 are further described hereinbelow with reference to Table 1.

[46074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1302 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46075] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1302 gene, herein designated VGAM is inhibition of expression of VGAM1302 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1302 correlate with, and may be deduced from, the identity of the target genes which VGAM1302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46076] LOC254528 (Accession XM_170797) is a VGAM1302 host target gene. LOC254528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254528, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254528 BINDING SITE, designated SEQ ID:45566, to the nucleotide sequence of VGAM1302 RNA, herein designated VGAM RNA, also designated SEQ ID:4013.

[46077] A function of VGAM1302 is therefore inhibition of LOC254528 (Accession XM_170797). Accordingly, utilities of VGAM1302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254528. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1303 (VGAM1303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46078] VGAM1303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1303 was detected is described hereinabove with reference to Figs. 1-8.

[46079] VGAM1303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5.

VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46080] VGAM1303 gene encodes a VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1303 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1303 precursor RNA is designated SEQ ID:1289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1289 is located at position 177616 relative to the genome of Human Herpesvirus 5.

[46081] VGAM1303 precursor RNA folds onto itself, forming VGAM1303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46082] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1303 folded precursor RNA into VGAM1303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1303 RNA is designated SEQ ID:4014, and is provided hereinbelow with reference to the sequence listing part.

[46083] VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1303 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46084] VGAM1303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1303 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46085] The complementary binding of VGAM1303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1303 host target RNA into VGAM1303 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46086] It is appreciated that VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1303 host target genes. The mRNA of each one of this plurality of VGAM1303 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1303 RNA, herein designated VGAM RNA, and which when bound by VGAM1303 RNA causes inhibition of translation of respective one or more VGAM1303 host target proteins.

[46087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1303 gene, herein designated VGAM GENE, on one or more VGAM1303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46088] It is yet further appreciated that a function of VGAM1303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1303 correlate with, and may be deduced from, the identity of the host target genes which VGAM1303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46089] Nucleotide sequences of the VGAM1303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1303 are further described hereinbelow with reference to Table 1.

[46090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1303 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46091] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1303 gene, herein designated VGAM is inhibition of expression of VGAM1303 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1303 correlate with, and may be deduced from, the identity of the target genes which VGAM1303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46092] Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is a VGAM1303 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10696, to the nu-

cleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46093] A function of VGAM1303 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. E2F Transcription Factor 3 (E2F3, Accession NM_001949) is another VGAM1303 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING SITE, designated SEQ ID:7667, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46094] Another function of VGAM1303 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM_001949),

a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069) is another VGAM1303 host target gene. GNAI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI1 BINDING SITE, designated SEQ ID:7839, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46095] Another function of VGAM1303 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069), a gene which is involved as modulators or

transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI1. The function of GNAI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Heparanase (HPSE, Accession NM_006665) is another VGAM1303 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13476, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46096] Another function of VGAM1303 is therefore inhibition of Heparanase (HPSE, Accession NM_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877) is another VGAM1303 host target gene. IL1R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL1R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1R1 BINDING SITE, designated SEQ ID:6565, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46097] Another function of VGAM1303 is therefore inhibition of Interleukin 1 Receptor, Type I (IL1R1, Accession NM_000877), a gene which is a receptor for interleukin-1 alpha (il-1a), beta (il-1b), and interleukin-1 receptor antagonist protein (il-1ra). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1R1. The function of IL1R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM704.MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM_005359) is another VGAM1303 host target gene. MADH4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MADH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH4 BINDING SITE, designated SEQ ID:11832, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46098] Another function of VGAM1303 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 4 (Drosophila) (MADH4, Accession NM_005359), a gene which common mediator of signal transduction by $\text{tgf-}\beta$ (transforming growth factor) superfamily; *smad4* is the common *smad* (co-*smad*). promotes binding of the *smad2/sm**ad4*/*fast-1* complex to dna and provides an activation function required for *smad1* or *smad2* to stimulate transcription. may act as a tumor suppressor. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH4. The function of MADH4 and its associ-

ation with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Regulator of G-protein Signalling 3 (RGS3, Accession NM_021106) is another VGAM1303 host target gene. RGS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RGS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS3 BINDING SITE, designated SEQ ID:22089, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46099] Another function of VGAM1303 is therefore inhibition of Regulator of G-protein Signalling 3 (RGS3, Accession NM_021106), a gene which negatively regulates G protein-coupled receptor signalling. Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3. The function of RGS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM404.DKFZp434G179 (Accession XM_087065) is

another VGAM1303 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39040, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46100] Another function of VGAM1303 is therefore inhibition of DKFZp434G179 (Accession XM_087065). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. DKFZP434J037 (Accession NM_030952) is another VGAM1303 host target gene. DKFZP434J037 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J037 BINDING SITE, designated SEQ ID:25218, to the nucleotide sequence of

VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46101] Another function of VGAM1303 is therefore inhibition of DKFZP434J037 (Accession NM_030952). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J037. DKFZP564J157 (Accession NM_018457) is another VGAM1303 host target gene. DKFZP564J157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564J157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564J157 BINDING SITE, designated SEQ ID:20528, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46102] Another function of VGAM1303 is therefore inhibition of DKFZP564J157 (Accession NM_018457). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J157. DQX1 (Accession NM_133637) is another VGAM1303 host target gene. DQX1 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DQX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DQX1 BINDING SITE, designated SEQ ID:28598, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46103] Another function of VGAM1303 is therefore inhibition of DQX1 (Accession NM_133637). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DQX1. FLJ10922 (Accession NM_018273) is another VGAM1303 host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20254, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46104] Another function of VGAM1303 is therefore inhibition of

FLJ10922 (Accession NM_018273). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. FLJ13769 (Accession NM_025012) is another VGAM1303 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24593, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46105] Another function of VGAM1303 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. KIAA1691 (Accession XM_166523) is another VGAM1303 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44468, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46106] Another function of VGAM1303 is therefore inhibition of KIAA1691 (Accession XM_166523). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1691. Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176) is another VGAM1303 host target gene. LGI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI2 BINDING SITE, designated SEQ ID:20000, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46107] Another function of VGAM1303 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 2 (LGI2, Accession NM_018176). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with LGI2. Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924) is another VGAM1303 host target gene. PMX2B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PMX2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX2B BINDING SITE, designated SEQ ID:10017, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46108] Another function of VGAM1303 is therefore inhibition of Paired Mesoderm Homeobox 2b (PMX2B, Accession NM_003924). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX2B. LOC144438 (Accession XM_084860) is another VGAM1303 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, desig-

nated SEQ ID:37735, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46109] Another function of VGAM1303 is therefore inhibition of LOC144438 (Accession XM_084860). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438. LOC147804 (Accession XM_085901) is another VGAM1303 host target gene. LOC147804 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147804, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147804 BINDING SITE, designated SEQ ID:38382, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46110] Another function of VGAM1303 is therefore inhibition of LOC147804 (Accession XM_085901). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147804. LOC148759 (Accession XM_097517) is another VGAM1303 host target gene. LOC148759 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148759 BINDING SITE, designated SEQ ID:40903, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46111] Another function of VGAM1303 is therefore inhibition of LOC148759 (Accession XM_097517). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148759. LOC253219 (Accession XM_173743) is another VGAM1303 host target gene. LOC253219 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253219 BINDING SITE, designated SEQ ID:46561, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46112] Another function of VGAM1303 is therefore inhibition of

LOC253219 (Accession XM_173743). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253219. LOC257358 (Accession XM_173138) is another VGAM1303 host target gene. LOC257358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257358 BINDING SITE, designated SEQ ID:46388, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46113] Another function of VGAM1303 is therefore inhibition of LOC257358 (Accession XM_173138). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257358. LOC91759 (Accession XM_040467) is another VGAM1303 host target gene. LOC91759 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91759 BINDING SITE, designated SEQ ID:33304, to the nucleotide sequence of VGAM1303 RNA, herein designated VGAM RNA, also designated SEQ ID:4014.

[46114] Another function of VGAM1303 is therefore inhibition of LOC91759 (Accession XM_040467). Accordingly, utilities of VGAM1303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91759. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1304 (VGAM1304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46115] VGAM1304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1304 was detected is described hereinabove with reference to Figs. 1–8.

[46116] VGAM1304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[46117] VGAM1304 gene encodes a VGAM1304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1304 precursor RNA is designated SEQ ID:1290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1290 is located at position 179588 relative to the genome of Human Herpesvirus 5.

[46118] VGAM1304 precursor RNA folds onto itself, forming VGAM1304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46119] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1304 folded precursor RNA into VGAM1304 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1304 RNA is designated SEQ ID:4015, and is provided hereinbelow with reference to the sequence listing part.

[46120] VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1304 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46121] VGAM1304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1304 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46122] The complementary binding of VGAM1304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1304 host target RNA into VGAM1304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46123] It is appreciated that VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1304 host target genes. The mRNA of each one of this plurality of VGAM1304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1304 RNA, herein designated VGAM RNA, and which when bound by VGAM1304 RNA causes inhibition of translation of respective one or more VGAM1304 host target proteins.

[46124] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1304 gene, herein designated VGAM GENE, on one or more VGAM1304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46125] It is yet further appreciated that a function of VGAM1304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1304 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1304 correlate with, and may be deduced from, the identity of the host target genes which VGAM1304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46126] Nucleotide sequences of the VGAM1304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1304 are further described hereinbelow with reference to Table 1.

[46127] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1304 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46128] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1304 gene, herein designated VGAM is inhibition of expression of VGAM1304 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1304 correlate with, and may be deduced from, the identity of the target genes which VGAM1304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46129] Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717) is a VGAM1304 host target gene. DGKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKI BINDING SITE, designated SEQ ID:11078, to the nucleotide sequence of VGAM1304 RNA, herein designated VGAM RNA, also designated SEQ ID:4015.

[46130] A function of VGAM1304 is therefore inhibition of Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM1304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKI. The function of DGKI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1107. DKFZp547J036 (Accession NM_032281) is another VGAM1304 host target gene. DKFZp547J036 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547J036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547J036 BINDING SITE, designated SEQ ID:26039, to the nucleotide sequence of VGAM1304 RNA, herein designated VGAM RNA, also designated SEQ ID:4015.

[46131] Another function of VGAM1304 is therefore inhibition of DKFZp547J036 (Accession NM_032281). Accordingly, utilities of VGAM1304 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp547J036. KIAA0872 (Accession NM_014940) is another VGAM1304 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17242, to the nucleotide sequence of VGAM1304 RNA, herein designated VGAM RNA, also designated SEQ ID:4015.

[46132] Another function of VGAM1304 is therefore inhibition of KIAA0872 (Accession NM_014940). Accordingly, utilities of VGAM1304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. KIAA1979 (Accession XM_113984) is another VGAM1304 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42589, to the

nucleotide sequence of VGAM1304 RNA, herein designated VGAM RNA, also designated SEQ ID:4015.

[46133] Another function of VGAM1304 is therefore inhibition of KIAA1979 (Accession XM_113984). Accordingly, utilities of VGAM1304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1305 (VGAM1305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46134] VGAM1305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1305 was detected is described hereinabove with reference to Figs. 1–8.

[46135] VGAM1305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46136] VGAM1305 gene encodes a VGAM1305 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1305 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1305 precursor RNA is designated SEQ ID:1291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1291 is located at position 409 relative to the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2).

- [46137] VGAM1305 precursor RNA folds onto itself, forming VGAM1305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46138] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1305 folded precursor RNA into VGAM1305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1305 RNA is designated SEQ ID:4016, and is provided hereinbelow with reference to the sequence listing part.

[46139] VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1305 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46140] VGAM1305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1305 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46141] The complementary binding of VGAM1305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1305 host target RNA into VGAM1305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46142] It is appreciated that VGAM1305 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1305 host target genes. The mRNA of each one of this plurality of VGAM1305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1305 RNA, herein designated VGAM RNA, and which when bound by VGAM1305 RNA causes inhibition of translation of respective one or more VGAM1305 host target proteins.

[46143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1305 gene, herein designated VGAM GENE, on one or more VGAM1305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[46144] It is yet further appreciated that a function of VGAM1305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1305 correlate with, and may be deduced from, the identity of the host target genes which VGAM1305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46145] Nucleotide sequences of the VGAM1305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1305 are further described hereinbelow with reference to Table 1.

[46146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1305 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46147] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1305 gene, herein designated VGAM is inhibition of expression of VGAM1305 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1305 correlate with, and may be deduced from, the identity of the target genes which VGAM1305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46148] Checkpoint Suppressor 1 (CHES1, Accession NM_005197) is a VGAM1305 host target gene. CHES1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHES1 BINDING SITE, designated SEQ ID:11697, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46149] A function of VGAM1305 is therefore inhibition of Check-

point Suppressor 1 (CHES1, Accession NM_005197). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHES1. Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM_004086) is another VGAM1305 host target gene. COCH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COCH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COCH BINDING SITE, designated SEQ ID:10292, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46150] Another function of VGAM1305 is therefore inhibition of Coagulation Factor C Homolog, Cochlin (*Limulus polyphemus*) (COCH, Accession NM_004086). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COCH. Dachshund Homolog (*Drosophila*) (DACH, Accession NM_080759) is another VGAM1305 host target gene. DACH BINDING SITE is HOST TARGET binding site found in

the 3` untranslated region of mRNA encoded by DACH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DACH BINDING SITE, designated SEQ ID:28034, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46151] Another function of VGAM1305 is therefore inhibition of Dachshund Homolog (Drosophila) (DACH, Accession NM_080759), a gene which regulates early progenitor cell proliferation during retinogenesis and pituitary development . Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DACH. The function of DACH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM260. Inositol Polyphosphate-5-phosphatase, 40kDa (INPP5A, Accession NM_005539) is another VGAM1305 host target gene. INPP5A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INPP5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of INPP5A BINDING SITE, designated SEQ ID:12066, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46152] Another function of VGAM1305 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 40kDa (INPP5A, Accession NM_005539), a gene which hydrolyzes the calcium-mobilizing second messenger $\text{ins}(1,4,5)\text{p}3$. Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5A. The function of INPP5A has been established by previous studies. The phosphatidylinositols serve as precursors for a number of different messenger molecules. Agonist stimulation of cells results in phosphatidylinositol turnover and the generation of inositol 1,4,5-triphosphate, $\text{Ins}(1,4,5)\text{P}3$, which mobilizes intracellular calcium. The inositol polyphosphate-5-phosphatase enzymes hydrolyze $\text{Ins}(1,4,5)\text{P}3$ in a signal-terminating reaction. Laxminarayan et al. (1994) isolated a 2.7-kb composite cDNA encoding the 43-kD membrane-associated 5-phosphatase by screening a human placental lambda-gt11 library using degenerate

oligonucleotides. The 2.7-kb cDNA contained a 1.1-kb open reading frame, comprising 363 amino acids, which encoded a protein of predicted molecular mass of 42 kD. They showed that a 73-amino acid domain in the COOH terminus of the 43-kD membrane-associated 5-phosphatase had 30% sequence identity and 67% similarity to a region in the 75-kD 5-phosphatase (OMIM Ref. No. 147264) and 34% identity and 70% similarity to a sequence in the protein that is encoded by the gene defective in Lowe oculocerebral renal syndrome (OMIM Ref. No. 309000). The 43-kD membrane-associated 5-phosphatase appeared to be predominantly expressed in heart, brain, and skeletal muscle.

[46153] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46154] Laxminarayan, K. M.; Chan, B. K.; Tetaz, T.; Bird, P. I.; Mitchell, C. A. : Characterization of a cDNA encoding the 43-kDa membrane-associated inositol-polyphosphate 5-phosphatase. J. Biol. Chem. 269: 17305-17310, 1994. ; and

[46155] Mitchell, C. A.; Speed, C. J.; Nicholl, J.; Sutherland, G. R. : Chromosomal mapping of the gene (INPP5A) encoding the

43-kDa membrane-associated inositol polyphosphate 5-phosphatase to 1.

[46156] Further studies establishing the function and utilities of INPP5A are found in John Hopkins OMIM database record ID 600106, and in cited publications numbered 878 and 8792 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleoporin 98kDa (NUP98, Accession NM_016320) is another VGAM1305 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18442, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46157] Another function of VGAM1305 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM_016320), a gene which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM_002885) is another VGAM1305 host target gene. RAP1GA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAP1GA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1GA1 BINDING SITE, designated SEQ ID:8797, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46158] Another function of VGAM1305 is therefore inhibition of RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM_002885). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1GA1. Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720) is another VGAM1305 host target gene. SOS2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOS2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOS2 BINDING SITE, designated SEQ ID:33999, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46159] Another function of VGAM1305 is therefore inhibition of Son of Sevenless Homolog 2 (Drosophila) (SOS2, Accession XM_043720). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOS2. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331) is another VGAM1305 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23630, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46160] Another function of VGAM1305 is therefore inhibition of

Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM_024331). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421) is another VGAM1305 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7121, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46161] Another function of VGAM1305 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM_001421). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF4. KIAA0218 (Accession NM_014760) is another VGAM1305 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16516, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46162] Another function of VGAM1305 is therefore inhibition of KIAA0218 (Accession NM_014760). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. KIAA0889 (Accession NM_015377) is another VGAM1305 host target gene. KIAA0889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0889 BINDING SITE, designated SEQ ID:17676, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46163] Another function of VGAM1305 is therefore inhibition of KIAA0889 (Accession NM_015377). Accordingly, utilities

of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0889. KIAA0945 (Accession NM_014952) is another VGAM1305 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17294, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46164] Another function of VGAM1305 is therefore inhibition of KIAA0945 (Accession NM_014952). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. KIAA1198 (Accession XM_032674) is another VGAM1305 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1198 BINDING SITE, designated SEQ ID:31707, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46165] Another function of VGAM1305 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. MGC2827 (Accession NM_023940) is another VGAM1305 host target gene. MGC2827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2827 BINDING SITE, designated SEQ ID:23424, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46166] Another function of VGAM1305 is therefore inhibition of MGC2827 (Accession NM_023940). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2827. TRIP-Br2 (Accession NM_014755) is another VGAM1305 host target gene. TRIP-Br2 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16484, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46167] Another function of VGAM1305 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC115110 (Accession XM_049825) is another VGAM1305 host target gene. LOC115110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115110 BINDING SITE, designated SEQ ID:35507, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46168] Another function of VGAM1305 is therefore inhibition of

LOC115110 (Accession XM_049825). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115110. LOC149506 (Accession XM_097661) is another VGAM1305 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41005, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46169] Another function of VGAM1305 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC152317 (Accession XM_098189) is another VGAM1305 host target gene. LOC152317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41466, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46170] Another function of VGAM1305 is therefore inhibition of LOC152317 (Accession XM_098189). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. LOC163882 (Accession XM_089211) is another VGAM1305 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39971, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46171] Another function of VGAM1305 is therefore inhibition of LOC163882 (Accession XM_089211). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163882. LOC253148 (Accession XM_173032) is an-

other VGAM1305 host target gene. LOC253148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253148 BINDING SITE, designated SEQ ID:46299, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46172] Another function of VGAM1305 is therefore inhibition of LOC253148 (Accession XM_173032). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253148. LOC90072 (Accession XM_028702) is another VGAM1305 host target gene. LOC90072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90072 BINDING SITE, designated SEQ ID:30727, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46173] Another function of VGAM1305 is therefore inhibition of LOC90072 (Accession XM_028702). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90072. LOC90630 (Accession XM_033046) is another VGAM1305 host target gene. LOC90630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90630 BINDING SITE, designated SEQ ID:31825, to the nucleotide sequence of VGAM1305 RNA, herein designated VGAM RNA, also designated SEQ ID:4016.

[46174] Another function of VGAM1305 is therefore inhibition of LOC90630 (Accession XM_033046). Accordingly, utilities of VGAM1305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90630. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1306 (VGAM1306) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[46175] VGAM1306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1306 was detected is described hereinabove with reference to Figs. 1–8.

[46176] VGAM1306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV–SAT2). VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46177] VGAM1306 gene encodes a VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1306 precursor RNA is designated SEQ ID:1292, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1292 is located at position 4577 relative to the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV–SAT2).

[46178] VGAM1306 precursor RNA folds onto itself, forming

VGAM1306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46179] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1306 folded precursor RNA into VGAM1306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1306 RNA is designated SEQ ID:4017, and is provided hereinbelow with reference to the sequence listing part.

[46180] VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1306 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46181] VGAM1306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1306 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46182] The complementary binding of VGAM1306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1306 host target RNA into VGAM1306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46183] It is appreciated that VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1306 host target genes. The mRNA of each one of this plurality of VGAM1306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1306 RNA, herein designated VGAM RNA, and which when bound by VGAM1306 RNA causes inhibition of translation of respective one or more VGAM1306 host target proteins.

[46184] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1306 gene, herein designated VGAM GENE, on one or more VGAM1306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46185] It is yet further appreciated that a function of VGAM1306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1306 correlate with, and may be deduced from, the identity of the host target genes which

VGAM1306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46186] Nucleotide sequences of the VGAM1306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1306 are further described hereinbelow with reference to Table 1.

[46187] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1306 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46188] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1306 gene, herein designated VGAM is inhibition of expression of VGAM1306 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1306 correlate with, and may be deduced from, the identity of the target genes which VGAM1306 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[46189] Alcohol Dehydrogenase 7 (class IV), Mu Or Sigma Polypeptide (ADH7, Accession NM_000673) is a VGAM1306 host target gene. ADH7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADH7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH7 BINDING SITE, designated SEQ ID:6326, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46190] A function of VGAM1306 is therefore inhibition of Alcohol Dehydrogenase 7 (class IV), Mu Or Sigma Polypeptide (ADH7, Accession NM_000673), a gene which retinol oxidation for the synthesis of retinoic acid, a hormone important for cellular differentiation. Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH7. The function of ADH7 has been established by previous studies. Satre et al. (1994) characterized a novel human alcohol dehydrogenase gene called ADH7 and determined that it encodes a class IV ADH that is very active as a

retinol dehydrogenase. They isolated a nearly full-length cDNA for ADH7 from a human stomach cDNA library and a 5-prime genomic clone containing exons 1 and 2 from a human genomic library. The deduced full-length amino acid sequence predicted a protein of 373 amino acids following the initiator methionine. The class IV identity of the sequence was confirmed by agreement with previously determined sequences for several human stomach class IV ADH peptides. Sequence comparison suggested that human ADH classes I and IV may have diverged from a common ancestor after the separation of the other classes, and may still share common physiologic functions. Satre et al. (1994) discussed the possibility that one of these functions is retinol oxidation for the synthesis of retinoic acid, a hormone important for cellular differentiation. Zgombic-Knight et al. (1995) demonstrated that the ADH7 gene has 9 exons and encodes a predicted polypeptide of 373 amino acids, excluding the amino-terminal methionine. ADH7 showed greater sequence identity with class I ADH (69%) than with classes II (e.g., 103740), III (e.g., 103710), or V, with which it is only 59–61% homologous. Zgombic-Knight et al. (1995) confirmed that ADH7 is the major stomach ADH, but, unlike the others, is absent from

liver. Also, transcriptional regulation of the ADH7 gene appeared to be different from that of the other classes in that the ADH7 promoter lacks a TATA box and GC boxes upstream of the transcription initiation site. As outlined by Osier et al. (2002), 7 genes encoding ADH enzymes exist in a cluster extending approximately 380 kb on the long arm of chromosome 4. The class I ADH genes exist in a tighter cluster of approximately 77 kb, flanked upstream by ADH7 and downstream by ADH6 (OMIM Ref. No. 103735), ADH4 (OMIM Ref. No. 103740), and ADH5 (OMIM Ref. No. 103710), in that order.

[46191] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46192] Zgombic-Knight, M.; Foglio, M. H.; Duester, G. : Genomic structure and expression of the ADH7 gene encoding human class IV alcohol dehydrogenase, the form most efficient for retinol metabolism in vitro. J. Biol. Chem. 270: 4305-4311, 1995. ; and

[46193] Osier, M. V.; Pakstis, A. J.; Soodyall, H.; Comas, D.; Goldman, D.; Odunsi, A.; Okonofua, F.; Parnas, J.; Schulz, L. O.; Bertranpetit, J.; Bonne-Tamir, B.; Lu, R.-B.; Kidd, J. R.; Kidd.

[46194] Further studies establishing the function and utilities of ADH7 are found in John Hopkins OMIM database record ID 600086, and in cited publications numbered 12102–7899 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM_173049) is another VGAM1306 host target gene. MEF2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2D BINDING SITE, designated SEQ ID:46308, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46195] Another function of VGAM1306 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide D (myocyte enhancer factor 2D) (MEF2D, Accession XM_173049), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2D.

The function of MEF2D has been established by previous studies. The MEF2 family of regulatory proteins are, like the myogenic basic helix–loop–helix proteins (see OMIM Ref. No. 159970), involved in myogenesis; see (OMIM Ref. No. 600660). Breitbart et al. (1993) obtained MEF2D cDNAs from an adult cardiac ventricle expression library screened at low stringency with a human MEF2B probe. One of the cDNAs encoded a 521–amino acid protein with highly conserved MADS and MEF2 domains. The recombinantly expressed MEF2D protein showed DNA binding to the MEF2 site. Breitbart et al. (1993) found that MEF2D occurs as several alternatively spliced transcripts, one of which resembles the *Xenopus* SRF–related factor SL–1. Unlike the other MEF2 family members, MEF2D is present in undifferentiated myoblasts and may participate in the earliest stages of commitment. Hobson et al. (1995) mapped the MEF2D gene to 1q12–q23 using somatic cell hybrid panel DNAs containing deletion or derivative chromosomes. Mouse Mef2D was mapped by Martin et al. (1994) to chromosome 3. Ikeshima et al. (1995) demonstrated strong expression of MEF2D in the cerebellum and cerebrum of developing mouse brains and also in central nervous system neurons of adult mice, suggesting that it

may be involved in the differentiation of neurogenic as well as myogenic cells.

[46196] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46197] Hobson, G. M.; Krahe, R.; Garcia, E.; Siciliano, M. J.; Funanage, V. L. : Regional chromosomal assignments for four members of the MADS domain transcription enhancer factor 2 (MEF2) gene family to human chromosomes 15q26, 19p12, 5q14, and 1q12–q23. *Genomics* 29: 704–711, 1995. ; and

[46199] Further studies establishing the function and utilities of MEF2D are found in John Hopkins OMIM database record ID 600663, and in cited publications numbered 8293–8294, 817 and 8296 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM1306 host target gene. WHSC1 BINDING SITE1 through WHSC1

BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28442, SEQ ID:28459 and SEQ ID:17178 respectively, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46200] Another function of VGAM1306 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. KIAA1276 (Accession XM_039169) is another VGAM1306 host target gene. KIAA1276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1276, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1276 BINDING SITE, designated SEQ ID:33019, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46201] Another function of VGAM1306 is therefore inhibition of KIAA1276 (Accession XM_039169). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1276. PRO0800 (Accession NM_018592) is another VGAM1306 host target gene. PRO0800 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0800 BINDING SITE, designated SEQ ID:20671, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46202] Another function of VGAM1306 is therefore inhibition of PRO0800 (Accession NM_018592). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRO0800. LOC148266 (Accession XM_086128) is another VGAM1306 host target gene. LOC148266 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148266 BINDING SITE, designated SEQ ID:38513, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46203] Another function of VGAM1306 is therefore inhibition of LOC148266 (Accession XM_086128). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148266. LOC151009 (Accession XM_097992) is another VGAM1306 host target gene. LOC151009 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151009 BINDING SITE, designated SEQ ID:41290, to

the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46204] Another function of VGAM1306 is therefore inhibition of LOC151009 (Accession XM_097992). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151009. LOC157660 (Accession XM_098805) is another VGAM1306 host target gene. LOC157660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157660 BINDING SITE, designated SEQ ID:41829, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46205] Another function of VGAM1306 is therefore inhibition of LOC157660 (Accession XM_098805). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157660. LOC170409 (Accession XM_096330) is another VGAM1306 host target gene. LOC170409 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC170409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170409 BINDING SITE, designated SEQ ID:40317, to the nucleotide sequence of VGAM1306 RNA, herein designated VGAM RNA, also designated SEQ ID:4017.

[46206] Another function of VGAM1306 is therefore inhibition of LOC170409 (Accession XM_096330). Accordingly, utilities of VGAM1306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1307 (VGAM1307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46207] VGAM1307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1307 was detected is described hereinabove with reference to Figs. 1-8.

[46208] VGAM1307 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46209] VGAM1307 gene encodes a VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1307 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1307 precursor RNA is designated SEQ ID:1293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1293 is located at position 5733 relative to the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2).

[46210] VGAM1307 precursor RNA folds onto itself, forming VGAM1307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[46211] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1307 folded precursor RNA into VGAM1307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1307 RNA is designated SEQ ID:4018, and is provided hereinbelow with reference to the sequence listing part.

[46212] VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1307 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46213] VGAM1307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1307 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1307 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[46214] The complementary binding of VGAM1307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1307 host target RNA into VGAM1307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46215] It is appreciated that VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1307 host target genes. The mRNA of each one of this plurality of VGAM1307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1307 RNA, herein designated VGAM RNA, and which when bound by VGAM1307 RNA causes inhibition of translation of respective one or more VGAM1307 host target proteins.

[46216] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1307 gene, herein designated VGAM GENE, on one or more VGAM1307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46217] It is yet further appreciated that a function of VGAM1307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1307 correlate with, and may be deduced from, the identity of the host target genes which VGAM1307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46218] Nucleotide sequences of the VGAM1307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1307 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1307 are further described hereinbelow with reference to Table 1.

[46219] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1307 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46220] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1307 gene, herein designated VGAM is inhibition of expression of VGAM1307 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1307 correlate with, and may be deduced from, the identity of the target genes which VGAM1307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46221] Growth Arrest-specific 11 (GAS11, Accession NM_001481) is a VGAM1307 host target gene. GAS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GAS11 BINDING SITE, designated SEQ ID:7219, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46222] A function of VGAM1307 is therefore inhibition of Growth Arrest-specific 11 (GAS11, Accession NM_001481). Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS11. LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055) is another VGAM1307 host target gene. LANCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12695, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46223] Another function of VGAM1307 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055), a gene which

binds the C-terminus of stomatin. Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM656. Microtubule-associated Protein Tau (MAPT, Accession NM_016835) is another VGAM1307 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:18831, SEQ ID:18837, SEQ ID:12537 and SEQ ID:18825 respectively, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46224] Another function of VGAM1307 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM_016835), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly,

utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPT. The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Neurexin 2 (NRXN2, Accession NM_138732) is another VGAM1307 host target gene. NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3, designated SEQ ID:28984, SEQ ID:17468 and SEQ ID:42767 respectively, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46225] Another function of VGAM1307 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_138732), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.FLJ10829 (Accession NM_018234) is another VGAM1307 host target gene. FLJ10829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10829 BINDING SITE, designated SEQ ID:20177, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46226] Another function of VGAM1307 is therefore inhibition of FLJ10829 (Accession NM_018234). Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10829. KIAA0923 (Accession NM_014021) is another VGAM1307 host target gene. KIAA0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0923 BINDING SITE, designated SEQ ID:15243, to the nucleotide sequence of VGAM1307 RNA, herein designated VGAM RNA, also designated SEQ ID:4018.

[46227] Another function of VGAM1307 is therefore inhibition of KIAA0923 (Accession NM_014021). Accordingly, utilities of VGAM1307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0923. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1308 (VGAM1308) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46228] VGAM1308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1308 was detected is described hereinabove with reference to Figs. 1–8.

[46229] VGAM1308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV–SAT2). VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, is a

human gene contained in the human genome.

[46230] VGAM1308 gene encodes a VGAM1308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1308 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1308 precursor RNA is designated SEQ ID:1294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1294 is located at position 4790 relative to the genome of Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2).

[46231] VGAM1308 precursor RNA folds onto itself, forming VGAM1308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46232] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1308 folded precursor RNA into VGAM1308

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1308 RNA is designated SEQ ID:4019, and is provided hereinbelow with reference to the sequence listing part.

[46233] VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1308 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46234] VGAM1308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1308 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46235] The complementary binding of VGAM1308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1308 host target RNA into VGAM1308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[46236] It is appreciated that VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1308 host target genes. The mRNA of each one of this plurality of VGAM1308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1308 RNA, herein designated VGAM RNA, and which when bound by VGAM1308 RNA causes inhibition of translation of respective one or more VGAM1308 host target proteins.

[46237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1308 gene, herein designated VGAM GENE, on one or more VGAM1308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46238] It is yet further appreciated that a function of VGAM1308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus SAT 2 (FMDV-SAT2). Specific functions, and accordingly utilities, of VGAM1308 correlate with, and may be deduced from, the identity of the host target genes which VGAM1308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46239] Nucleotide sequences of the VGAM1308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1308 are further described hereinbelow with reference to Table 1.

[46240] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1308 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46241] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1308 gene, herein designated VGAM is inhibition of expression of VGAM1308 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1308 correlate with, and may be deduced from, the identity of the target genes which VGAM1308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46242] Aprataxin (APTX, Accession NM_017692) is a VGAM1308 host target gene. APTX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APTX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APTX BINDING SITE, designated SEQ ID:19250, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ

ID:4019.

[46243] A function of VGAM1308 is therefore inhibition of Aprataxin (APTX, Accession NM_017692). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APTX. CERD4 (Accession NM_012074) is another VGAM1308 host target gene. CERD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CERD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CERD4 BINDING SITE, designated SEQ ID:14350, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46244] Another function of VGAM1308 is therefore inhibition of CERD4 (Accession NM_012074). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CERD4. G Protein-coupled Receptor Kinase 6 (GPRK6, Accession NM_002082) is another VGAM1308 host target gene. GPRK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPRK6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPRK6 BINDING SITE, designated SEQ ID:7877, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46245] Another function of VGAM1308 is therefore inhibition of G Protein-coupled Receptor Kinase 6 (GPRK6, Accession NM_002082), a gene which regulates the G protein-coupled receptors. Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPRK6. The function of GPRK6 has been established by previous studies. By PCR on neutrophil cDNA using primers based on sequences of known receptor kinases, Haribabu and Snyderman (1993) identified GPRK5 (OMIM Ref. No. 600870) and GPRK6 sequences. Using a fragment of the GPRK6 PCR clone to screen a cDNA library, they isolated a cDNA encoding GPRK6. Sequence analysis predicted that the 544-amino acid GPRK6 protein contains the conserved DLG (asp-leu-gly) and ENIL (glu-asn-ile-leu) motifs. Northern blot analysis detected 2.1- and 2.9-kb GPRK6 transcripts in all tissues tested, with strongest expression in placenta

and skeletal muscle. By somatic cell hybrid analysis, Haribabu and Snyderman (1993) mapped the GPRK6 gene and a closely related gene to chromosomes 5 and 13, respectively. Bullrich et al. (1995) mapped GPRK6 to 5q35 by analysis of a rodent human hybrid panel. The GPRK6-related locus was found to map to 13pter-q21.

[46246] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46247] Bullrich, F.; Druck, T.; Kunapuli, P.; Gomez, J.; Gripp, K. W.; Schlegelberger, B.; Lasota, J.; Aronson, M.; Cannizzaro, L. A.; Huebner, K.; Benovic, J. L. : Chromosomal mapping of the genes GPRK5 and GPRK6 encoding G protein-coupled receptor kinases GRK5 and GRK6. *Cytogenet. Cell Genet.* 70: 250-254, 1995. ; and

[46248] Haribabu, B.; Snyderman, R. : Identification of additional members of human G-protein-coupled receptor kinase multigene family. *Proc. Nat. Acad. Sci.* 90: 9398-9402, 1993.

[46249] Further studies establishing the function and utilities of GPRK6 are found in John Hopkins OMIM database record ID 600869, and in cited publications numbered 7022-7023 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169) is another VGAM1308 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40303, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46250] Another function of VGAM1308 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169), a gene which hydrolyzes Ins(1,3,4,5)P₄ and PtdIns(3,4,5)P₃; contains an SH2-domain. Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM64.Mab-21-like 1 (*C. elegans*) (MAB21L1, Accession

NM_005584) is another VGAM1308 host target gene. MAB21L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAB21L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L1 BINDING SITE, designated SEQ ID:12112, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46251] Another function of VGAM1308 is therefore inhibition of Mab-21-like 1 (*C. elegans*) (MAB21L1, Accession NM_005584), a gene which may control cerebellum and eye development; very strongly similar to murine Mm.10798. Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L1. The function of MAB21L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM_002734) is another VGAM1308 host target

gene. PRKAR1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKAR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR1A BINDING SITE, designated SEQ ID:8607, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46252] Another function of VGAM1308 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM_002734). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR1A. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM1308 host target gene. SCD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:11495, to the nu-

cleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46253] Another function of VGAM1308 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM314. Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660) is another VGAM1308 host target gene. TGFB1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TGFB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB1 BINDING SITE, designated SEQ ID:6320, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46254] Another function of VGAM1308 is therefore inhibition of

Transforming Growth Factor, Beta 1 (Camurati-Engelmann disease) (TGFB1, Accession NM_000660). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB1. Zinc Finger Protein 236 (ZNF236, Accession NM_007345) is another VGAM1308 host target gene. ZNF236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF236 BINDING SITE, designated SEQ ID:14275, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46255] Another function of VGAM1308 is therefore inhibition of Zinc Finger Protein 236 (ZNF236, Accession NM_007345). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF236. Cyclin M4 (CNNM4, Accession NM_020184) is another VGAM1308 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:21424, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46256] Another function of VGAM1308 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM_020184). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM4. DDM36 (Accession NM_020962) is another VGAM1308 host target gene. DDM36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:21951, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46257] Another function of VGAM1308 is therefore inhibition of DDM36 (Accession NM_020962). Accordingly, utilities of

VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. DKFZp761B0514 (Accession NM_032289) is another VGAM1308 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26049, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46258] Another function of VGAM1308 is therefore inhibition of DKFZp761B0514 (Accession NM_032289). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. Fibroblast Growth Factor 19 (FGF19, Accession NM_005117) is another VGAM1308 host target gene. FGF19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF19 BINDING SITE, designated SEQ ID:11595, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46259] Another function of VGAM1308 is therefore inhibition of Fibroblast Growth Factor 19 (FGF19, Accession NM_005117). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF19. FLJ12547 (Accession NM_024992) is another VGAM1308 host target gene. FLJ12547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12547 BINDING SITE, designated SEQ ID:24546, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46260] Another function of VGAM1308 is therefore inhibition of FLJ12547 (Accession NM_024992). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12547. KIAA0296 (Accession NM_014699) is another VGAM1308 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16219, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46261] Another function of VGAM1308 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. KIAA0523 (Accession XM_041964) is another VGAM1308 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33640, to the

nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46262] Another function of VGAM1308 is therefore inhibition of KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA1297 (Accession XM_051005) is another VGAM1308 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35720, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46263] Another function of VGAM1308 is therefore inhibition of KIAA1297 (Accession XM_051005). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. KREMEN (Accession NM_032045) is another VGAM1308 host target gene. KREMEN BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KREMEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KREMEN BINDING SITE, designated SEQ ID:25759, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46264] Another function of VGAM1308 is therefore inhibition of KREMEN (Accession NM_032045). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KREMEN. MGC5457 (Accession NM_032633) is another VGAM1308 host target gene. MGC5457 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5457 BINDING SITE, designated SEQ ID:26347, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46265] Another function of VGAM1308 is therefore inhibition of MGC5457 (Accession NM_032633). Accordingly, utilities

of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5457. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM1308 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34881, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46266] Another function of VGAM1308 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. PRO1430 (Accession NM_018599) is another VGAM1308 host target gene. PRO1430 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1430 BINDING SITE, designated SEQ ID:20677, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46267] Another function of VGAM1308 is therefore inhibition of PRO1430 (Accession NM_018599). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1430. LOC130951 (Accession NM_138804) is another VGAM1308 host target gene. LOC130951 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130951 BINDING SITE, designated SEQ ID:29027, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46268] Another function of VGAM1308 is therefore inhibition of LOC130951 (Accession NM_138804). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC130951. LOC201324 (Accession XM_043753) is another VGAM1308 host target gene. LOC201324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201324 BINDING SITE, designated SEQ ID:34013, to the nucleotide sequence of VGAM1308 RNA, herein designated VGAM RNA, also designated SEQ ID:4019.

[46269] Another function of VGAM1308 is therefore inhibition of LOC201324 (Accession XM_043753). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201324. LOC256021 (Accession XM_172884) is another VGAM1308 host target gene. LOC256021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256021 BINDING SITE, designated SEQ ID:46166, to the nucleotide sequence of VGAM1308 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4019.

[46270] Another function of VGAM1308 is therefore inhibition of LOC256021 (Accession XM_172884). Accordingly, utilities of VGAM1308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256021. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1309 (VGAM1309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46271] VGAM1309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1309 was detected is described hereinabove with reference to Figs. 1–8.

[46272] VGAM1309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46273] VGAM1309 gene encodes a VGAM1309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1309 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1309 precursor RNA is designated SEQ ID:1295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1295 is located at position 28090 relative to the genome of Human Adenovirus D.

- [46274] VGAM1309 precursor RNA folds onto itself, forming VGAM1309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46275] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1309 folded precursor RNA into VGAM1309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1309 RNA is designated SEQ ID:4020, and is provided hereinbelow with reference to the sequence listing part.

[46276] VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1309 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46277] VGAM1309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1309 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[46278] The complementary binding of VGAM1309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1309 host target RNA into VGAM1309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46279] It is appreciated that VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1309 host target genes. The mRNA of

each one of this plurality of VGAM1309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1309 RNA, herein designated VGAM RNA, and which when bound by VGAM1309 RNA causes inhibition of translation of respective one or more VGAM1309 host target proteins.

[46280] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1309 gene, herein designated VGAM GENE, on one or more VGAM1309 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[46281] It is yet further appreciated that a function of VGAM1309 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1309 correlate with, and may be deduced from, the identity of the host target genes which VGAM1309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46282] Nucleotide sequences of the VGAM1309 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1309 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1309 are further described hereinbelow with reference to Table 1.

[46283] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1309 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1309 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46284] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1309 gene, herein designated VGAM is inhibition of expression of VGAM1309 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1309 correlate with, and may be deduced from, the identity of the target genes which VGAM1309 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46285] Cyclin-dependent Kinase Inhibitor 2D (p19, inhibits CDK4) (CDKN2D, Accession NM_001800) is a VGAM1309 host target gene. CDKN2D BINDING SITE1 and CDKN2D BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDKN2D, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2D BINDING SITE1 and CDKN2D BINDING SITE2, designated SEQ ID:7555 and SEQ ID:27817 respectively, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46286] A function of VGAM1309 is therefore inhibition of Cyclin-

dependent Kinase Inhibitor 2D (p19, inhibits CDK4) (CDKN2D, Accession NM_001800), a gene which interacts strongly with cdk4 and cdk6. Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2D. The function of CDKN2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809) is another VGAM1309 host target gene. NXF2 BINDING SITE1 and NXF2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NXF2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF2 BINDING SITE1 and NXF2 BINDING SITE2, designated SEQ ID:19458 and SEQ ID:22590 respectively, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46287] Another function of VGAM1309 is therefore inhibition of Nuclear RNA Export Factor 2 (NXF2, Accession NM_017809), a gene which is involved in the export of

mrna from the nucleus to the cytoplasm. Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF2. The function of NXF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. ZFP93 (Accession NM_004234) is another VGAM1309 host target gene. ZFP93 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP93, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP93 BINDING SITE, designated SEQ ID:10428, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46288] Another function of VGAM1309 is therefore inhibition of ZFP93 (Accession NM_004234). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP93. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033331) is another VGAM1309 host target gene. CDC14B BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by CDC14B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE, designated SEQ ID:27161, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46289] Another function of VGAM1309 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM_033331). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. FLJ12806 (Accession NM_022831) is another VGAM1309 host target gene. FLJ12806 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23108, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46290] Another function of VGAM1309 is therefore inhibition of FLJ12806 (Accession NM_022831). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. HSPC065 (Accession NM_014157) is another VGAM1309 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15454, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46291] Another function of VGAM1309 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. 5-hydroxytryptamine (serotonin) Receptor 3A (HTR3A, Accession NM_000869) is another VGAM1309 host target gene. HTR3A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HTR3A, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR3A BINDING SITE, designated SEQ ID:6538, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46292] Another function of VGAM1309 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 3A (HTR3A, Accession NM_000869). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR3A. LANO (Accession NM_018214) is another VGAM1309 host target gene. LANO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:20129, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46293] Another function of VGAM1309 is therefore inhibition of LANO (Accession NM_018214). Accordingly, utilities of

VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO. PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM_015148) is another VGAM1309 host target gene. PASK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PASK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:17503, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46294] Another function of VGAM1309 is therefore inhibition of PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM_015148). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK. LOC145663 (Accession XM_096829) is another VGAM1309 host target gene. LOC145663 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC145663 BINDING SITE, designated SEQ ID:40551, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46295] Another function of VGAM1309 is therefore inhibition of LOC145663 (Accession XM_096829). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145663. LOC157507 (Accession XM_088312) is another VGAM1309 host target gene. LOC157507 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157507, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157507 BINDING SITE, designated SEQ ID:39606, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46296] Another function of VGAM1309 is therefore inhibition of LOC157507 (Accession XM_088312). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157507. LOC221337 (Accession XM_166387) is an-

other VGAM1309 host target gene. LOC221337 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221337 BINDING SITE, designated SEQ ID:44235, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46297] Another function of VGAM1309 is therefore inhibition of LOC221337 (Accession XM_166387). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. LOC92340 (Accession XM_044426) is another VGAM1309 host target gene. LOC92340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92340 BINDING SITE, designated SEQ ID:34200, to the nucleotide sequence of VGAM1309 RNA, herein designated VGAM RNA, also designated SEQ ID:4020.

[46298] Another function of VGAM1309 is therefore inhibition of LOC92340 (Accession XM_044426). Accordingly, utilities of VGAM1309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92340. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1310 (VGAM1310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46299] VGAM1310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1310 was detected is described hereinabove with reference to Figs. 1–8.

[46300] VGAM1310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus D. VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46301] VGAM1310 gene encodes a VGAM1310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1310 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1310 precursor RNA is designated SEQ ID:1296, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1296 is located at position 24460 relative to the genome of Human Adenovirus D.

[46302] VGAM1310 precursor RNA folds onto itself, forming VGAM1310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46303] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1310 folded precursor RNA into VGAM1310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1310 RNA is designated SEQ ID:4021, and is provided hereinbelow with reference to the sequence listing part.

[46304] VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1310 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[46305] VGAM1310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1310 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46306] The complementary binding of VGAM1310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1310 host target RNA into VGAM1310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46307] It is appreciated that VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1310 host target genes. The mRNA of each one of this plurality of VGAM1310 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1310 RNA, herein designated VGAM RNA, and which when bound by VGAM1310 RNA causes inhibition of translation of respective one or more VGAM1310 host target proteins.

[46308] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1310 gene, herein designated VGAM GENE, on one or more VGAM1310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46309] It is yet further appreciated that a function of VGAM1310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of viral infection by Human Adenovirus D. Specific functions, and accordingly utilities, of VGAM1310 correlate with, and may be deduced from, the identity of the host target genes which VGAM1310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46310] Nucleotide sequences of the VGAM1310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1310 are further described hereinbelow with reference to Table 1.

[46311] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1310 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1310 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[46312] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1310 gene, herein designated VGAM is inhibition of expression of VGAM1310 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1310 correlate with, and may be deduced from, the identity of the target genes which VGAM1310 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46313] B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707) is a VGAM1310 host target gene. BCL7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7B BINDING SITE, designated SEQ ID:7437, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46314] A function of VGAM1310 is therefore inhibition of B-cell CLL/lymphoma 7B (BCL7B, Accession NM_001707), a gene which is of yet unknown function. Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with BCL7B. The function of BCL7B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_019616) is another VGAM1310 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:21239 and SEQ ID:5610 respectively, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46315] Another function of VGAM1310 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM_019616). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. RAD51-like 3 (*S. cerevisiae*) (RAD51L3, Accession NM_133630) is another VGAM1310 host target gene.

RAD51L3 BINDING SITE1 and RAD51L3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD51L3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD51L3 BINDING SITE1 and RAD51L3 BINDING SITE2, designated SEQ ID:28581 and SEQ ID:25181 respectively, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46316] Another function of VGAM1310 is therefore inhibition of RAD51-like 3 (*S. cerevisiae*) (RAD51L3, Accession NM_133630), a gene which may have a role in dna repair and recombination. Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD51L3. The function of RAD51L3 has been established by previous studies. The *S. cerevisiae* gene RAD51, which encodes a protein related to the ATP-binding *E. coli* RecA protein, is critical for DNA repair and meiotic recombination. Homologs of this gene have been identified in several species, including mouse and human. Pittman et al. (1998) reported the identification of a novel member of

the RAD51 gene family in both mouse and human. The mouse cDNA, Rad51d, isolated by screening EST databases with yeast RAD55 and human RAD51B amino acid sequences, encodes a predicted 329-amino acid protein with a molecular mass of 35,260 Da. Northern blot analysis revealed the presence of multiple transcripts of the Rad51d gene in all tissues examined. Southern analysis of genomic DNA from 7 mammalian species demonstrated that the RAD51D gene is conserved. Pittman et al. (1998) used the mouse nucleotide sequence to screen a human EST database and identified 2 RAD51D cDNA clones from human T-lymphocyte and placenta libraries; both cDNAs appeared to be variants of the mouse gene. The shorter cDNA represented an alternatively spliced product and excluded sequences corresponding to 2 exons in the mouse gene, one of which encodes the first ATP-binding motif. The longer cDNA skipped a single exon present in the mouse gene, resulting in a frameshift and a predicted truncated protein. The authors stated that if the frameshift is ignored, the full-length putative 289-amino acid protein shares 71% sequence identity with the predicted mouse protein, and the mouse and human RAD51D genes have 2 conserved ATP-binding do-

mains similar to other RecA-related genes. Cartwright et al. (1998) also isolated human and mouse RAD51L3, or R51H3, cDNAs. They found that the sequence of the predicted 328-amino acid human protein is 82% identical to that of mouse RAD51L3. Northern blot analysis revealed that human RAD51L3 is expressed as a 1.7-kb mRNA in all tissues, with the highest levels in testis.

[46317] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46318] Pittman, D. L.; Weinberg, L. R.; Schimenti, J. C. : Identification, characterization, and genetic mapping of Rad51d, a new mouse and human RAD51/RecA-related gene. *Genomics* 49: 103–111, 1998. ; and

[46319] Cartwright, R.; Dunn, A. M.; Simpson, P. J.; Tambini, C. E.; Thacker, J. : Isolation of novel human and mouse genes of the recA/RAD51 recombination-repair gene family. *Nucleic Acids Res.*

[46320] Further studies establishing the function and utilities of RAD51L3 are found in John Hopkins OMIM database record ID 602954, and in cited publications numbered 1597, 8639–160 and 8640 listed in the bibliography section hereinbelow, which are also hereby incorporated by

reference.DKFZp434G171 (Accession XM_086583) is another VGAM1310 host target gene. DKFZp434G171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G171 BINDING SITE, designated SEQ ID:38777, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46321] Another function of VGAM1310 is therefore inhibition of DKFZp434G171 (Accession XM_086583). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G171. FBP17 (Accession XM_052666) is another VGAM1310 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36050, to the nucleotide se-

quence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46322] Another function of VGAM1310 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ00001 (Accession XM_088525) is another VGAM1310 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39785, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46323] Another function of VGAM1310 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ12056 (Accession NM_024933) is another VGAM1310 host target gene. FLJ12056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12056 BINDING SITE, designated SEQ ID:24470, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46324] Another function of VGAM1310 is therefore inhibition of FLJ12056 (Accession NM_024933). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12056. G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM_014030) is another VGAM1310 host target gene. GIT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT1 BINDING SITE, designated SEQ ID:15257, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46325] Another function of VGAM1310 is therefore inhibition of G

Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM_014030). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT1. Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM_002751) is another VGAM1310 host target gene. MAPK11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK11 BINDING SITE, designated SEQ ID:8628, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46326] Another function of VGAM1310 is therefore inhibition of Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM_002751). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK11. Tumor Necrosis Factor Receptor Superfamily, Member 19-like (TNFRSF19L, Accession NM_032871) is another VGAM1310 host target gene. TNFRSF19L BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by TNFRSF19L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF19L BINDING SITE, designated SEQ ID:26687, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46327] Another function of VGAM1310 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 19-like (TNFRSF19L, Accession NM_032871). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF19L. LOC146475 (Accession XM_097006) is another VGAM1310 host target gene. LOC146475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146475 BINDING SITE, designated SEQ ID:40701, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46328] Another function of VGAM1310 is therefore inhibition of LOC146475 (Accession XM_097006). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146475. LOC148753 (Accession XM_097515) is another VGAM1310 host target gene. LOC148753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148753 BINDING SITE, designated SEQ ID:40899, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46329] Another function of VGAM1310 is therefore inhibition of LOC148753 (Accession XM_097515). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148753. LOC220002 (Accession XM_166224) is another VGAM1310 host target gene. LOC220002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220002, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220002 BINDING SITE, designated SEQ ID:44050, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46330] Another function of VGAM1310 is therefore inhibition of LOC220002 (Accession XM_166224). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220002. LOC255265 (Accession XM_170902) is another VGAM1310 host target gene. LOC255265 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255265 BINDING SITE, designated SEQ ID:45659, to the nucleotide sequence of VGAM1310 RNA, herein designated VGAM RNA, also designated SEQ ID:4021.

[46331] Another function of VGAM1310 is therefore inhibition of LOC255265 (Accession XM_170902). Accordingly, utilities of VGAM1310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255265. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1311 (VGAM1311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46332] VGAM1311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1311 was detected is described hereinabove with reference to Figs. 1–8.

[46333] VGAM1311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46334] VGAM1311 gene encodes a VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1311 precursor RNA is designated SEQ ID:1297, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1297 is located at position 3024 relative to the genome of Foot-and-mouth Disease Virus C.

- [46335] VGAM1311 precursor RNA folds onto itself, forming VGAM1311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46336] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1311 folded precursor RNA into VGAM1311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1311 RNA is designated SEQ ID:4022, and is provided hereinbelow with reference to the sequence listing part.

[46337] VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1311 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46338] VGAM1311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1311 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46339] The complementary binding of VGAM1311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1311 host target RNA into VGAM1311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46340] It is appreciated that VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1311 host target genes. The mRNA of each one of this plurality of VGAM1311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1311 RNA, herein designated VGAM RNA, and which when bound by VGAM1311 RNA causes

inhibition of translation of respective one or more VGAM1311 host target proteins.

[46341] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1311 gene, herein designated VGAM GENE, on one or more VGAM1311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46342] It is yet further appreciated that a function of VGAM1311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1311 include diagnosis, prevention and

treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of VGAM1311 correlate with, and may be deduced from, the identity of the host target genes which VGAM1311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46343] Nucleotide sequences of the VGAM1311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1311 are further described hereinbelow with reference to Table 1.

[46344] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1311 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46345] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1311 gene, herein designated VGAM is inhibition of expression of VGAM1311 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1311 correlate with, and may be deduced from, the identity of the target genes which VGAM1311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46346] Copine VII (CPNE7, Accession NM_014427) is a VGAM1311 host target gene. CPNE7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPNE7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPNE7 BINDING SITE, designated SEQ ID:15786, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46347] A function of VGAM1311 is therefore inhibition of Copine VII (CPNE7, Accession NM_014427). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPNE7. Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111) is another VGAM1311 host target gene. IHPK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IHPK3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IHPK3 BINDING SITE, designated SEQ ID:27655, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46348] Another function of VGAM1311 is therefore inhibition of Inositol Hexaphosphate Kinase 3 (IHPK3, Accession NM_054111). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IHPK3. Kruppel-like Factor 8 (KLF8, Accession NM_007250) is another VGAM1311 host target gene. KLF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF8 BINDING SITE, designated SEQ ID:14121, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46349] Another function of VGAM1311 is therefore inhibition of Kruppel-like Factor 8 (KLF8, Accession NM_007250). Ac-

cordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF8. Matrix Metalloproteinase 19 (MMP19, Accession NM_022790) is another VGAM1311 host target gene. MMP19 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MMP19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE, designated SEQ ID:23073, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46350] Another function of VGAM1311 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_022790). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. Transcription Factor 20 (AR1) (TCF20, Accession XM_040067) is another VGAM1311 host target gene. TCF20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TCF20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF20 BINDING SITE, designated SEQ ID:33247, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46351] Another function of VGAM1311 is therefore inhibition of Transcription Factor 20 (AR1) (TCF20, Accession XM_040067), a gene which is strongly similar to murine Tcf20 and may act as a transcription activator. Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF20. The function of TCF20 has been established by previous studies. Stromelysins, which are the metalloproteinases with the widest substrate specificities, play a critical role in tumor invasion and metastasis. See 185261. Stromelysin expression is induced by mitogens, oncogenes, and inflammatory cytokines. A 19-nucleotide promoter element called the SPRE (stromelysin-1 PDGF-responsive element), controls stromelysin-1 (OMIM Ref. No. 185250) expression in response to mitogen stimulation. Sanz et al. (1995) screened a mouse fibroblast expression library to identify factors that bind to the SPRE. They isolated a cDNA encoding a predicted 937-amino

acid protein designated SPBP for 'SPRE-binding protein.' SPBP contains several features characteristic of transcription factors, including a putative leucine zipper region, a nuclear localization signal, and a basic domain similar to the DNA-binding domain found in the Fos (OMIM Ref. No. 164810)–Jun (OMIM Ref. No. 165160) family of transcription factors. However, while in Fos and Jun the ZIP and DNA-binding domains lie very close together, in SPBP they are widely separated. Sanz et al. (1995) found that expression of SPBP in mammalian cells activated transcription of a reporter gene construct containing either the full-length stromelysin promoter or a single copy of the SPRE inserted upstream of a heterologous promoter. Rajadhyaksha et al. (1998) identified cDNAs encoding AR1, a human SPBP homolog. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, Rajadhyaksha et al. (1998) localized the AR1 gene to 22q13.3.

[46352] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46353] Rajadhyaksha, A. Riviere, M.; Van Vooren, P.; Szpirer, J.; Szpirer, C.; Babin, J.; Bina, M. : Assignment of AR1, transcription factor 20 (TCF20), to human chromosome

22q13.3 with somatic cell hybrids and in situ hybridization. Cytogenet. Cell Genet. 81: 176–177, 1998. ; and

[46354] Sanz, L.; Moscat, J.; Diaz-Meco, M. T. : Molecular characterization of a novel transcription factor that controls stromelysin expression. Molec. Cell. Biol. 15: 3164–3170, 1995.

[46355] Further studies establishing the function and utilities of TCF20 are found in John Hopkins OMIM database record ID 603107, and in cited publications numbered 8494–8495 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. STAF42 (Accession NM_053053) is another VGAM1311 host target gene. STAF42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAF42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF42 BINDING SITE, designated SEQ ID:27596, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46356] Another function of VGAM1311 is therefore inhibition of STAF42 (Accession NM_053053). Accordingly, utilities of

VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF42. LOC146520 (Accession XM_085492) is another VGAM1311 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38185, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46357] Another function of VGAM1311 is therefore inhibition of LOC146520 (Accession XM_085492). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC253502 (Accession XM_170561) is another VGAM1311 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC253502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253502 BINDING SITE, designated SEQ ID:45379, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46358] Another function of VGAM1311 is therefore inhibition of LOC253502 (Accession XM_170561). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. LOC90750 (Accession XM_033868) is another VGAM1311 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:31973, to the nucleotide sequence of VGAM1311 RNA, herein designated VGAM RNA, also designated SEQ ID:4022.

[46359] Another function of VGAM1311 is therefore inhibition of LOC90750 (Accession XM_033868). Accordingly, utilities of VGAM1311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1312 (VGAM1312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46360] VGAM1312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1312 was detected is described hereinabove with reference to Figs. 1–8.

[46361] VGAM1312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46362] VGAM1312 gene encodes a VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1312 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1312 precursor RNA is designated SEQ ID:1298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1298 is located at position 1074 relative to the

genome of Foot-and-mouth Disease Virus C.

[46363] VGAM1312 precursor RNA folds onto itself, forming VGAM1312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46364] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1312 folded precursor RNA into VGAM1312 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1312 RNA is designated SEQ ID:4023, and is provided hereinbelow with reference to the sequence listing part.

[46365] VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1312 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46366] VGAM1312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1312 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[46367] The complementary binding of VGAM1312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1312 host target RNA into VGAM1312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46368] It is appreciated that VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1312 host target genes. The mRNA of each one of this plurality of VGAM1312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1312 RNA, herein designated VGAM RNA, and which when bound by VGAM1312 RNA causes inhibition of translation of respective one or more VGAM1312 host target proteins.

[46369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1312 gene, herein designated VGAM GENE, on one or more VGAM1312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46370] It is yet further appreciated that a function of VGAM1312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of

VGAM1312 correlate with, and may be deduced from, the identity of the host target genes which VGAM1312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46371] Nucleotide sequences of the VGAM1312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1312 are further described hereinbelow with reference to Table 1.

[46372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1312 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46373] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1312 gene, herein designated VGAM is inhibition of expression of VGAM1312 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1312 correlate with, and may be deduced

from, the identity of the target genes which VGAM1312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46374] Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is a VGAM1312 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13700, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46375] A function of VGAM1312 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170) is another VGAM1312 host target gene. SLC1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SLC1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A1 BINDING SITE, designated SEQ ID:10379, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46376] Another function of VGAM1312 is therefore inhibition of Solute Carrier Family 1 (neuronal/epithelial high affinity glutamate transporter, system Xag), Member 1 (SLC1A1, Accession NM_004170), a gene which is a glutamate transporter, essential for terminating the postsynaptic action of glutamate by rapidly removing it from the synaptic cleft. Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A1. The function of SLC1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044) is another VGAM1312 host target gene. SLC6A12 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by SLC6A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A12 BINDING SITE, designated SEQ ID:9009, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46377] Another function of VGAM1312 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044), a gene which transports betaine and gaba. Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A12. The function of SLC6A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM293. Transporter 2, ATP-binding Cassette, Subfamily B (MDR/TAP) (TAP2, Accession NM_000544) is another VGAM1312 host target gene. TAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAP2 BINDING SITE, designated SEQ ID:6141, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46378] Another function of VGAM1312 is therefore inhibition of Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544), a gene which is involved in the transport of antigens from the cytoplasm to a membrane-bound compartment for association with mhc class i molecules. Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAP2. The function of TAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM_015511) is another VGAM1312 host target gene. C20orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of C20orf4 BINDING SITE, designated SEQ ID:17771, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46379] Another function of VGAM1312 is therefore inhibition of Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM_015511). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf4. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769) is another VGAM1312 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12335, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46380] Another function of VGAM1312 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769). Accordingly, utilities of

VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. CTAGE-1 (Accession NM_022663) is another VGAM1312 host target gene. CTAGE-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTAGE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTAGE-1 BINDING SITE, designated SEQ ID:22909, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46381] Another function of VGAM1312 is therefore inhibition of CTAGE-1 (Accession NM_022663). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTAGE-1. HSPC129 (Accession NM_016396) is another VGAM1312 host target gene. HSPC129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC129

BINDING SITE, designated SEQ ID:18534, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46382] Another function of VGAM1312 is therefore inhibition of HSPC129 (Accession NM_016396). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC129. KIAA1323 (Accession XM_032146) is another VGAM1312 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31569, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46383] Another function of VGAM1312 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. KIAA1462 (Accession XM_166132) is another VGAM1312 host target gene. KIAA1462 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43920, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46384] Another function of VGAM1312 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. P66 (Accession NM_020699) is another VGAM1312 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P66, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21848, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46385] Another function of VGAM1312 is therefore inhibition of

P66 (Accession NM_020699). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. PRO1635 (Accession NM_018589) is another VGAM1312 host target gene. PRO1635 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1635 BINDING SITE, designated SEQ ID:20667, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46386] Another function of VGAM1312 is therefore inhibition of PRO1635 (Accession NM_018589). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1635. TRIP-Br2 (Accession NM_014755) is another VGAM1312 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16479, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46387] Another function of VGAM1312 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC221178 (Accession XM_167936) is another VGAM1312 host target gene. LOC221178 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221178 BINDING SITE, designated SEQ ID:44926, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46388] Another function of VGAM1312 is therefore inhibition of LOC221178 (Accession XM_167936). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221178. LOC221300 (Accession XM_166322) is an-

other VGAM1312 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:44148, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46389] Another function of VGAM1312 is therefore inhibition of LOC221300 (Accession XM_166322). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221300. LOC221712 (Accession XM_168059) is another VGAM1312 host target gene. LOC221712 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221712 BINDING SITE, designated SEQ ID:44975, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46390] Another function of VGAM1312 is therefore inhibition of LOC221712 (Accession XM_168059). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221712. LOC256849 (Accession XM_173059) is another VGAM1312 host target gene. LOC256849 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256849, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256849 BINDING SITE, designated SEQ ID:46313, to the nucleotide sequence of VGAM1312 RNA, herein designated VGAM RNA, also designated SEQ ID:4023.

[46391] Another function of VGAM1312 is therefore inhibition of LOC256849 (Accession XM_173059). Accordingly, utilities of VGAM1312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256849. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1313 (VGAM1313) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[46392] VGAM1313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1313 was detected is described hereinabove with reference to Figs. 1–8.

[46393] VGAM1313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46394] VGAM1313 gene encodes a VGAM1313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1313 precursor RNA is designated SEQ ID:1299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1299 is located at position 4912 relative to the genome of Foot-and-mouth Disease Virus C.

[46395] VGAM1313 precursor RNA folds onto itself, forming VGAM1313 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46396] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1313 folded precursor RNA into VGAM1313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1313 RNA is designated SEQ ID:4024, and is provided hereinbelow with reference to the sequence listing part.

[46397] VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1313 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46398] VGAM1313 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1313 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46399] The complementary binding of VGAM1313 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1313 host target RNA into VGAM1313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46400] It is appreciated that VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1313 host target genes. The mRNA of each one of this plurality of VGAM1313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1313 RNA, herein designated VGAM RNA, and which when bound by VGAM1313 RNA causes inhibition of translation of respective one or more VGAM1313 host target proteins.

[46401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1313 gene, herein designated VGAM GENE, on one or more VGAM1313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46402] It is yet further appreciated that a function of VGAM1313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of VGAM1313 correlate with, and may be deduced from, the identity of the host target genes which VGAM1313 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[46403] Nucleotide sequences of the VGAM1313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1313 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1313 are further described hereinbelow with reference to Table 1.

[46404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1313 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46405] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1313 gene, herein designated VGAM is inhibition of expression of VGAM1313 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1313 correlate with, and may be deduced from, the identity of the target genes which VGAM1313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46406] Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652) is a VGAM1313 host target gene. AQP6 BINDING SITE1 and AQP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AQP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 and AQP6 BINDING SITE2, designated SEQ ID:7359 and SEQ ID:27614 respectively, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46407] A function of VGAM1313 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM_001652), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.GRB2-associated Binding Protein 2 (GAB2, Ac-

cession NM_012296) is another VGAM1313 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:14652 and SEQ ID:27847 respectively, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46408] Another function of VGAM1313 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53.HMT1 HnRNP Methyltransferase-like 1 (*S. cerevisiae*) (HRMT1L1, Accession XM_036869) is another VGAM1313 host target gene. HRMT1L1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRMT1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRMT1L1 BINDING SITE, designated SEQ ID:32506, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46409] Another function of VGAM1313 is therefore inhibition of HMT1 HnRNP Methyltransferase-like 1 (*S. cerevisiae*) (HRMT1L1, Accession XM_036869), a gene which is post-translational methylation of arginine residues. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRMT1L1. The function of HRMT1L1 has been established by previous studies. Katsanis et al. (1997) isolated a novel transcript from chromosome 21 that they found to be similar to the rat protein arginine N-methyltransferase-1 gene (PRMT1) reported by Lin et al. (1996). Katsanis et al. (1997) mapped the human gene (HRMT1L1) to chromosome 21 by study of monochromosomal cell hybrids and fine mapped the gene by PCR analysis of a partial chromosome 21 hybrid panel to a telom-

eric position on 21q22.3. Hybridization to a YAC that was positive for S100B (OMIM Ref. No. 176990) indicated that HRMT1L1 is no more than 10 kb from S100B. S100B was the most telomeric chromosome 21 gene known at that time. Katsanis et al. (1997) found that HRMT1L1 was expressed in all tissues they investigated. They noted that the function of such protein methyltransferases is post-translational methylation of arginine residues. Two types of activity had been described, attributed to different classes of enzymes. One methylates myelin protein zero (MPZ; 159440); the other was originally thought to methylate histones, but was later found to methylate hnRNPs far more efficiently. The authors suggested that this human homolog of yeast RMT1 associates with hnRNPs. Scott et al. (1998) further characterized HRMT1L1 and HRMT1L2. By Northern blot analysis, they found that HRMT1L1 is expressed as a 2.4-kb transcript in various adult and fetal tissues. The HRMT1L1 protein could not methylate hnRNPA1 (OMIM Ref. No. 164017) or any other tested substrate in vitro, and did not complement a yeast arginine methyltransferase mutant strain.

[46410] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [46411] Lin, W. J.; Gary, J. D.; Yang, M. C.; Clarke, S.; Herschman, H. R. : The mammalian intermediate–early TIS21 protein and the leukemia–associated BTG1 protein interact with a protein–arginine N–methyltransferase. J. Biol. Chem. 271: 15034–15044, 1996. ; and
- [46412] Scott, H. S.; Antonarakis, S. E.; Lalioti, M. D.; Rossier, C.; Silver, P. A.; Henry, M. F. : Identification and characterization of two putative human arginine methyltransferases (HRMT1.
- [46413] Further studies establishing the function and utilities of HRMT1L1 are found in John Hopkins OMIM database record ID 601961, and in cited publications numbered 5819–5821 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine Zipper–EF–hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318) is another VGAM1313 host target gene. LETM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LETM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LETM1 BINDING SITE, des–

ignated SEQ ID:14697, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46414] Another function of VGAM1313 is therefore inhibition of Leucine Zipper-EF-hand Containing Transmembrane Protein 1 (LETM1, Accession NM_012318). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LETM1. Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM_012325) is another VGAM1313 host target gene. MAPRE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPRE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPRE1 BINDING SITE, designated SEQ ID:14708, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46415] Another function of VGAM1313 is therefore inhibition of Microtubule-associated Protein, RP/EB Family, Member 1 (MAPRE1, Accession NM_012325). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MAPRE1. Myotubularin Related Protein 6 (MTMR6, Accession XM_167970) is another VGAM1313 host target gene. MTMR6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTMR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR6 BINDING SITE, designated SEQ ID:44936, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46416] Another function of VGAM1313 is therefore inhibition of Myotubularin Related Protein 6 (MTMR6, Accession XM_167970). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR6. Natural Killer-tumor Recognition Sequence (NKTR, Accession NM_005385) is another VGAM1313 host target gene. NKTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NKTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of NKTR BINDING SITE, designated SEQ ID:11863, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46417] Another function of VGAM1313 is therefore inhibition of Natural Killer–tumor Recognition Sequence (NKTR, Accession NM_005385), a gene which is involved in the function of nk cells. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKTR. The function of NKTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM133.Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332) is another VGAM1313 host target gene. WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WHSC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE1 through WHSC1 BINDING SITE3, designated SEQ ID:28444, SEQ ID:28461 and SEQ

ID:17180 respectively, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46418] Another function of VGAM1313 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133332), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787) is another VGAM1313 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16660, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46419] Another function of VGAM1313 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. FLJ10314 (Accession NM_018055) is another VGAM1313 host target gene. FLJ10314 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10314 BINDING SITE, designated SEQ ID:19817, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46420] Another function of VGAM1313 is therefore inhibition of FLJ10314 (Accession NM_018055). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10314. FLJ20171 (Accession NM_017697) is another VGAM1313 host target gene. FLJ20171 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20171, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20171 BINDING SITE, designated SEQ ID:19261, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46421] Another function of VGAM1313 is therefore inhibition of FLJ20171 (Accession NM_017697). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20171. KIAA0229 (Accession XM_166478) is another VGAM1313 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44403, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46422] Another function of VGAM1313 is therefore inhibition of KIAA0229 (Accession XM_166478). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0229. KIAA0410 (Accession NM_014778) is another VGAM1313 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16619, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46423] Another function of VGAM1313 is therefore inhibition of KIAA0410 (Accession NM_014778). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. KIAA0565 (Accession XM_039912) is another VGAM1313 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33215, to the

nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46424] Another function of VGAM1313 is therefore inhibition of KIAA0565 (Accession XM_039912). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. KIAA1462 (Accession XM_166132) is another VGAM1313 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:43918, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46425] Another function of VGAM1313 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. MIC2 Like 1 (MIC2L1, Accession NM_031462) is another VGAM1313 host target gene. MIC2L1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by MIC2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIC2L1 BINDING SITE, designated SEQ ID:25490, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46426] Another function of VGAM1313 is therefore inhibition of MIC2 Like 1 (MIC2L1, Accession NM_031462). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIC2L1. Nuclear Autoantigenic Sperm Protein (histone-binding) (NASP, Accession XM_042664) is another VGAM1313 host target gene. NASP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NASP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NASP BINDING SITE, designated SEQ ID:33738, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46427] Another function of VGAM1313 is therefore inhibition of

Nuclear Autoantigenic Sperm Protein (histone-binding) (NASP, Accession XM_042664). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NASP. ZFP106 (Accession NM_022473) is another VGAM1313 host target gene. ZFP106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP106 BINDING SITE, designated SEQ ID:22830, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46428] Another function of VGAM1313 is therefore inhibition of ZFP106 (Accession NM_022473). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP106. LOC152220 (Accession XM_098176) is another VGAM1313 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41443, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46429] Another function of VGAM1313 is therefore inhibition of LOC152220 (Accession XM_098176). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC254057 (Accession XM_173085) is another VGAM1313 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46349, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46430] Another function of VGAM1313 is therefore inhibition of LOC254057 (Accession XM_173085). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC254057. LOC254302 (Accession XM_171219) is another VGAM1313 host target gene. LOC254302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254302 BINDING SITE, designated SEQ ID:46005, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46431] Another function of VGAM1313 is therefore inhibition of LOC254302 (Accession XM_171219). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254302. LOC254874 (Accession XM_171217) is another VGAM1313 host target gene. LOC254874 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254874, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254874 BINDING SITE, designated SEQ ID:46004, to the nucleotide sequence of VGAM1313 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4024.

[46432] Another function of VGAM1313 is therefore inhibition of LOC254874 (Accession XM_171217). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254874. LOC256207 (Accession XM_170837) is another VGAM1313 host target gene. LOC256207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256207 BINDING SITE, designated SEQ ID:45616, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46433] Another function of VGAM1313 is therefore inhibition of LOC256207 (Accession XM_170837). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256207. LOC257407 (Accession XM_173078) is another VGAM1313 host target gene. LOC257407 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257407, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257407 BINDING SITE, designated SEQ ID:46335, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46434] Another function of VGAM1313 is therefore inhibition of LOC257407 (Accession XM_173078). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257407. LOC90170 (Accession XM_029589) is another VGAM1313 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE, designated SEQ ID:30908, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46435] Another function of VGAM1313 is therefore inhibition of LOC90170 (Accession XM_029589). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90170. LOC90268 (Accession XM_030424) is another VGAM1313 host target gene. LOC90268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90268 BINDING SITE, designated SEQ ID:31043, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46436] Another function of VGAM1313 is therefore inhibition of LOC90268 (Accession XM_030424). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90268. LOC91496 (Accession XM_038788) is another VGAM1313 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:32917, to the

nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46437] Another function of VGAM1313 is therefore inhibition of LOC91496 (Accession XM_038788). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. LOC91661 (Accession NM_138372) is another VGAM1313 host target gene. LOC91661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:28752, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46438] Another function of VGAM1313 is therefore inhibition of LOC91661 (Accession NM_138372). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661. LOC92997 (Accession XM_048690) is another VGAM1313 host target gene. LOC92997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC92997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92997 BINDING SITE, designated SEQ ID:35220, to the nucleotide sequence of VGAM1313 RNA, herein designated VGAM RNA, also designated SEQ ID:4024.

[46439] Another function of VGAM1313 is therefore inhibition of LOC92997 (Accession XM_048690). Accordingly, utilities of VGAM1313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1314 (VGAM1314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46440] VGAM1314 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1314 was detected is described hereinabove with reference to Figs. 1-8.

[46441] VGAM1314 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46442] VGAM1314 gene encodes a VGAM1314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1314 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1314 precursor RNA is designated SEQ ID:1300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1300 is located at position 4399 relative to the genome of Foot-and-mouth Disease Virus C.

[46443] VGAM1314 precursor RNA folds onto itself, forming VGAM1314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46444] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1314 folded precursor RNA into VGAM1314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1314 RNA is designated SEQ ID:4025, and is provided hereinbelow with reference to the sequence listing part.

[46445] VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1314 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46446] VGAM1314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1314 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46447] The complementary binding of VGAM1314 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1314

host target RNA into VGAM1314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46448] It is appreciated that VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1314 host target genes. The mRNA of each one of this plurality of VGAM1314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1314 RNA, herein designated VGAM RNA, and which when bound by VGAM1314 RNA causes inhibition of translation of respective one or more VGAM1314 host target proteins.

[46449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1314 gene, herein designated VGAM GENE, on one or more VGAM1314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46450] It is yet further appreciated that a function of VGAM1314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of VGAM1314 correlate with, and may be deduced from, the identity of the host target genes which VGAM1314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46451] Nucleotide sequences of the VGAM1314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1314 are further

described hereinbelow with reference to Table 1.

[46452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1314 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46453] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1314 gene, herein designated VGAM is inhibition of expression of VGAM1314 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1314 correlate with, and may be deduced from, the identity of the target genes which VGAM1314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46454] BCL2-like 2 (BCL2L2, Accession NM_004050) is a VGAM1314 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BIND-

ING SITE, designated SEQ ID:10257, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46455] A function of VGAM1314 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431. Caspase Recruitment Domain Family, Member 15 (CARD15, Accession NM_022162) is another VGAM1314 host target gene. CARD15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARD15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD15 BINDING SITE, designated SEQ ID:22716, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46456] Another function of VGAM1314 is therefore inhibition of

Caspase Recruitment Domain Family, Member 15

(CARD15, Accession NM_022162), a gene which serves as an intracellular receptor for bacterial products in monocytes and transduces signals leading to NF κ B activation. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD15. The function of CARD15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM126.Diaphorase (NADH) (cytochrome b-5 reductase) (DIA1, Accession NM_007326) is another VGAM1314 host target gene. DIA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIA1 BINDING SITE, designated SEQ ID:14247, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46457] Another function of VGAM1314 is therefore inhibition of Diaphorase (NADH) (cytochrome b-5 reductase) (DIA1,

Accession NM_007326). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIA1. Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009) is another VGAM1314 host target gene. FGF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF7 BINDING SITE, designated SEQ ID:7750, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46458] Another function of VGAM1314 is therefore inhibition of Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009), a gene which growth factor active on keratinocytes. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF7. The function of FGF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM678. Glycoprotein A Repetitions Predominant

(GARP, Accession NM_005512) is another VGAM1314 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12030, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46459] Another function of VGAM1314 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491) is another VGAM1314 host target gene. GCNT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT2 BINDING SITE, designated SEQ

ID:7238, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46460] Another function of VGAM1314 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM_001491), a gene which converts linear into branched poly-n-acetyllactosaminoglycans. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT2. The function of GCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM943. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_138619) is another VGAM1314 host target gene. GGA3 BINDING SITE1 and GGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA3 BINDING SITE1 and GGA3 BINDING SITE2, designated SEQ ID:28903 and SEQ

ID:15200 respectively, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46461] Another function of VGAM1314 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM_138619), a gene which may play a role in the regulation of membrane traffic through the trans-golgi network. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA3. The function of GGA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM353. Nuclear Respiratory Factor 1 (NRF1, Accession XM_011548) is another VGAM1314 host target gene. NRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRF1 BINDING SITE, designated SEQ ID:30191, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46462] Another function of VGAM1314 is therefore inhibition of Nuclear Respiratory Factor 1 (NRF1, Accession XM_011548), a gene which is a basic leucine zipper (bZIP) transcriptional activator and involved in the regulation of genes for EIF2A and respiratory subunits. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRF1. The function of NRF1 has been established by previous studies. Gopalakrishnan and Scarpulla (1995) noted that the electron transport chain and oxidative phosphorylation system rely on the functional interplay of gene products expressed from both nuclear and mitochondrial genomes. Because of the limited coding capacity of the mitochondrial chromosome, nuclear genes must provide most of the respiratory subunits and all of the gene products necessary for mitochondrial DNA transcription and replication. Nuclear respiratory factor-1 (NRF1) is a transcription factor that acts on nuclear genes encoding respiratory subunits and components of the mitochondrial transcription and replication machinery. Virbasius et al. (1993) cloned the human NRF1 cDNA from HeLa cells using degenerate primers based on partial tryptic peptide sequences and showed a predicted 504 amino acid pro-

tein encoded by a 2,970 nucleotide cDNA. The recombinantly expressed protein activated transcription of several NRF1-responsive promoters. Animal model experiments lend further support to the function of NRF1.

[46463] It is appreciated that the abovementioned animal model for NRF1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[46464] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46465] Gopalakrishnan, L.; Scarpulla, R. C. : Structure, expression, and chromosomal assignment of the human gene encoding nuclear respiratory factor 1. J. Biol. Chem. 270: 18019–18025, 1995. ; and

[46466] Virbasius, C. A.; Virbasius, J. V.; Scarpulla, R. C. : NRF-1, an activator involved in nuclear-mitochondrial interactions, utilizes a new DNA-binding domain conserved in a family of dev.

[46467] Further studies establishing the function and utilities of NRF1 are found in John Hopkins OMIM database record ID 600879, and in cited publications numbered 6852–6855, 714 and 10060 listed in the bibliography section herein–

below, which are also hereby incorporated by reference. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531) is another VGAM1314 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8368, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46468] Another function of VGAM1314 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM_002531), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Synaptogyrin 1 (SYNGR1, Accession

NM_004711) is another VGAM1314 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11065, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46469] Another function of VGAM1314 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545) is another VGAM1314 host target gene. TCF1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF1 BINDING SITE, designated SEQ ID:6148, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46470] Another function of VGAM1314 is therefore inhibition of Transcription Factor 1, Hepatic; LF-B1, Hepatic Nuclear Factor (HNF1), Albumin Proximal Factor (TCF1, Accession NM_000545), a gene which is required for the expression of several liver specific genes. binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF1. The function of TCF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Aquaporin 9 (AQP9, Accession NM_020980) is another VGAM1314 host target gene. AQP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP9, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP9 BINDING SITE, designated SEQ ID:21968, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46471] Another function of VGAM1314 is therefore inhibition of Aquaporin 9 (AQP9, Accession NM_020980). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP9. Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175) is another VGAM1314 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:14022, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46472] Another function of VGAM1314 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession

NM_007175). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. DKFZP586I2223 (Accession NM_015438) is another VGAM1314 host target gene. DKFZP586I2223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586I2223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586I2223 BINDING SITE, designated SEQ ID:17731, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46473] Another function of VGAM1314 is therefore inhibition of DKFZP586I2223 (Accession NM_015438). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586I2223. FLJ20275 (Accession NM_017737) is another VGAM1314 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:19322, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46474] Another function of VGAM1314 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20275. FLJ21742 (Accession NM_032207) is another VGAM1314 host target gene. FLJ21742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21742 BINDING SITE, designated SEQ ID:25913, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46475] Another function of VGAM1314 is therefore inhibition of FLJ21742 (Accession NM_032207). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21742. FYVE and Coiled-coil Domain Containing 1

(FYCO1, Accession NM_024513) is another VGAM1314 host target gene. FYCO1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FYCO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FYCO1 BINDING SITE, designated SEQ ID:23709, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46476] Another function of VGAM1314 is therefore inhibition of FYVE and Coiled-coil Domain Containing 1 (FYCO1, Accession NM_024513). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FYCO1. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM1314 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32529, to the nucleotide se-

quence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46477] Another function of VGAM1314 is therefore inhibition of Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. KIAA0319 (Accession NM_014809) is another VGAM1314 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16762, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46478] Another function of VGAM1314 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. KIAA0672 (Accession NM_014859) is another VGAM1314 host target gene. KIAA0672 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0672 BINDING SITE, designated SEQ ID:16919, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46479] Another function of VGAM1314 is therefore inhibition of KIAA0672 (Accession NM_014859). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0672. KIAA1036 (Accession NM_014909) is another VGAM1314 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17133, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46480] Another function of VGAM1314 is therefore inhibition of

KIAA1036 (Accession NM_014909). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1280 (Accession XM_045766) is another VGAM1314 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34551, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46481] Another function of VGAM1314 is therefore inhibition of KIAA1280 (Accession XM_045766). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. KIAA1855 (Accession XM_166453) is another VGAM1314 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44358, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46482] Another function of VGAM1314 is therefore inhibition of KIAA1855 (Accession XM_166453). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211) is another VGAM1314 host target gene. LOXL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOXL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOXL4 BINDING SITE, designated SEQ ID:25930, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46483] Another function of VGAM1314 is therefore inhibition of Lysyl Oxidase-like 4 (LOXL4, Accession NM_032211). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with LOXL4. SCMH1 (Accession NM_012236) is another VGAM1314 host target gene. SCMH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCMH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCMH1 BINDING SITE, designated SEQ ID:14539, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46484] Another function of VGAM1314 is therefore inhibition of SCMH1 (Accession NM_012236). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCMH1. Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782) is another VGAM1314 host target gene. SNAP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP29 BINDING SITE, designated SEQ ID:11187, to the nucleotide sequence of VGAM1314 RNA,

herein designated VGAM RNA, also designated SEQ ID:4025.

[46485] Another function of VGAM1314 is therefore inhibition of Synaptosomal-associated Protein, 29kDa (SNAP29, Accession NM_004782). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP29. LOC112868 (Accession XM_053402) is another VGAM1314 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36084, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46486] Another function of VGAM1314 is therefore inhibition of LOC112868 (Accession XM_053402). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC132880 (Accession XM_059609) is another VGAM1314 host target gene. LOC132880 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC132880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132880 BINDING SITE, designated SEQ ID:37031, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46487] Another function of VGAM1314 is therefore inhibition of LOC132880 (Accession XM_059609). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132880. LOC136015 (Accession XM_072440) is another VGAM1314 host target gene. LOC136015 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC136015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136015 BINDING SITE, designated SEQ ID:37501, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46488] Another function of VGAM1314 is therefore inhibition of

LOC136015 (Accession XM_072440). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136015. LOC142927 (Accession XM_084380) is another VGAM1314 host target gene. LOC142927 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC142927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:37567, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46489] Another function of VGAM1314 is therefore inhibition of LOC142927 (Accession XM_084380). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927. LOC143425 (Accession XM_113695) is another VGAM1314 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42355, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46490] Another function of VGAM1314 is therefore inhibition of LOC143425 (Accession XM_113695). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC145566 (Accession XM_085174) is another VGAM1314 host target gene. LOC145566 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145566 BINDING SITE, designated SEQ ID:37897, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46491] Another function of VGAM1314 is therefore inhibition of LOC145566 (Accession XM_085174). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145566. LOC151391 (Accession XM_098050) is an-

other VGAM1314 host target gene. LOC151391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151391 BINDING SITE, designated SEQ ID:41335, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46492] Another function of VGAM1314 is therefore inhibition of LOC151391 (Accession XM_098050). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151391. LOC152200 (Accession XM_098174) is another VGAM1314 host target gene. LOC152200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152200 BINDING SITE, designated SEQ ID:41439, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46493] Another function of VGAM1314 is therefore inhibition of LOC152200 (Accession XM_098174). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152200. LOC154788 (Accession XM_098607) is another VGAM1314 host target gene. LOC154788 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154788 BINDING SITE, designated SEQ ID:41726, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46494] Another function of VGAM1314 is therefore inhibition of LOC154788 (Accession XM_098607). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154788. LOC219505 (Accession XM_166086) is another VGAM1314 host target gene. LOC219505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219505, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219505 BINDING SITE, designated SEQ ID:43853, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46495] Another function of VGAM1314 is therefore inhibition of LOC219505 (Accession XM_166086). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219505. LOC219988 (Accession XM_166223) is another VGAM1314 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44043, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46496] Another function of VGAM1314 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219988. LOC222936 (Accession XM_170043) is another VGAM1314 host target gene. LOC222936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222936 BINDING SITE, designated SEQ ID:45309, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46497] Another function of VGAM1314 is therefore inhibition of LOC222936 (Accession XM_170043). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222936. LOC56965 (Accession NM_020213) is another VGAM1314 host target gene. LOC56965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56965 BINDING SITE, designated SEQ ID:21452, to the nucleotide sequence of VGAM1314 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4025.

[46498] Another function of VGAM1314 is therefore inhibition of LOC56965 (Accession NM_020213). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56965. LOC85414 (Accession NM_033102) is another VGAM1314 host target gene. LOC85414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC85414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85414 BINDING SITE, designated SEQ ID:26951, to the nucleotide sequence of VGAM1314 RNA, herein designated VGAM RNA, also designated SEQ ID:4025.

[46499] Another function of VGAM1314 is therefore inhibition of LOC85414 (Accession NM_033102). Accordingly, utilities of VGAM1314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85414. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1315 (VGAM1315) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46500] VGAM1315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1315 was detected is described hereinabove with reference to Figs. 1–8.

[46501] VGAM1315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46502] VGAM1315 gene encodes a VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1315 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1315 precursor RNA is designated SEQ ID:1301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1301 is located at position 7067 relative to the genome of Foot-and-mouth Disease Virus C.

[46503] VGAM1315 precursor RNA folds onto itself, forming

VGAM1315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46504] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1315 folded precursor RNA into VGAM1315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM1315 RNA is designated SEQ ID:4026, and is provided hereinbelow with reference to the sequence listing part.

[46505] VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1315 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[46506] VGAM1315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1315 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46507] The complementary binding of VGAM1315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1315 host target RNA into VGAM1315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46508] It is appreciated that VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1315 host target genes. The mRNA of each one of this plurality of VGAM1315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1315 RNA, herein designated VGAM RNA, and which when bound by VGAM1315 RNA causes inhibition of translation of respective one or more VGAM1315 host target proteins.

[46509] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1315 gene, herein designated VGAM GENE, on one or more VGAM1315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46510] It is yet further appreciated that a function of VGAM1315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of VGAM1315 correlate with, and may be deduced from, the identity of the host target genes which VGAM1315 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46511] Nucleotide sequences of the VGAM1315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1315 are further described hereinbelow with reference to Table 1.

[46512] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1315 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46513] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1315 gene, herein designated VGAM is inhibition of expression of VGAM1315 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1315 correlate with, and may be deduced from, the identity of the target genes which VGAM1315 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[46514] Ca²⁺–dependent Activator Protein For Secretion (CADPS, Accession XM_036915) is a VGAM1315 host target gene. CADPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CADPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CADPS BINDING SITE, designated SEQ ID:32507, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46515] A function of VGAM1315 is therefore inhibition of Ca²⁺–dependent Activator Protein For Secretion (CADPS, Accession XM_036915), a gene which is required for the Ca²⁺–regulated exocytosis of secretory vesicles. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CADPS. The function of CADPS has been established by previous studies. Calcium–activated secretion in neuroendocrine cells is dependent on ATP and cytosolic proteins such as NSF (OMIM Ref. No. 601633), SNAPs (see OMIM Ref. No. 603215) GTP–binding proteins, and com–

ponents of a vesicle coat complex. Walent et al. (1992) isolated a rat cytosolic factor, which they termed p145, that reconstitutes Ca^{2+} -activated secretion via dense core vesicle exocytosis in permeable neuroendocrine cells. The protein is a dimer of 145-kD subunits. By screening rat brain cDNA libraries with anti-p145, Ann et al. (1997) obtained a cDNA encoding a protein of 1,289 amino acids, which they designated CAPS. Sequence analysis revealed an overall hydrophilic protein with 2 potential coiled-coil regions. Northern blot analysis on mRNA from human tissue revealed expression of a 5.6-kb transcript in brain, pancreas, hypothalamus, pituitary, and adrenal, but not in heart, placenta, lung, liver, skeletal muscle, or kidney. The sequence of rat CAPS is 75% similar and 54% identical to that of *C. elegans* UNC31; loss-of-function UNC31 mutants exhibit multiple nervous system defects. Equilibrium dialysis studies showed that CAPS is a calcium-binding protein. By subcellular fractionation of isolated rat presynaptic nerve terminals, or synaptosomes, Berwin et al. (1998) determined that CAPS is primarily associated with plasma membranes and large dense core vesicles but not with small clear synaptic vesicles.

[46516] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [46517] Walent, J. H.; Porter, B. W.; Martin, T. F. J. : A novel 145 kd brain cytosolic protein reconstitutes $\text{Ca}(2+)$ -regulated secretion in permeable neuroendocrine cells. *Cell* 70: 765-775, 1992. ; and
- [46518] Ann, K.; Kowalchuk, J. A.; Loyet, K. M.; Martin, T. F. J. : Novel $\text{Ca}(2+)$ -binding protein (CAPS) related to UNC-31 required for $\text{Ca}(2+)$ -activated exocytosis. *J. Biol. Chem.* 272: 19637-1964.
- [46519] Further studies establishing the function and utilities of CADPS are found in John Hopkins OMIM database record ID 604667, and in cited publications numbered 7478-7481 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin D2 (CCND2, Accession NM_001759) is another VGAM1315 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7515, to the nucleotide sequence of

VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46520] Another function of VGAM1315 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the G1/s (start) transition. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.EphB4 (EPHB4, Accession NM_004444) is another VGAM1315 host target gene. EPHB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB4 BINDING SITE, designated SEQ ID:10739, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46521] Another function of VGAM1315 is therefore inhibition of EphB4 (EPHB4, Accession NM_004444), a gene which re-

ceptor for members of the ephrin-b family. binds to ephrin-b2. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB4. The function of EPHB4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM808. Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995) is another VGAM1315 host target gene. LAMP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LAMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LAMP2 BINDING SITE, designated SEQ ID:15185, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46522] Another function of VGAM1315 is therefore inhibition of Lysosomal-associated Membrane Protein 2 (LAMP2, Accession NM_013995). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LAMP2. LIM Do-

main Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM_005578) is another VGAM1315 host target gene. LPP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:12107, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46523] Another function of VGAM1315 is therefore inhibition of LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM_005578). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037) is another VGAM1315 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of LRP4 BINDING SITE, designated SEQ ID:32200, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46524] Another function of VGAM1315 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM_035037). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Antigen Identified By Monoclonal Antibody MRC OX-2 (MOX2, Accession XM_039962) is another VGAM1315 host target gene. MOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOX2 BINDING SITE, designated SEQ ID:33236, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46525] Another function of VGAM1315 is therefore inhibition of Antigen Identified By Monoclonal Antibody MRC OX-2 (MOX2, Accession XM_039962). Accordingly, utilities of

VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOX2. Nebulin-related Anchoring Protein (NRAP, Accession NM_006175) is another VGAM1315 host target gene. NRAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAP BINDING SITE, designated SEQ ID:12833, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46526] Another function of VGAM1315 is therefore inhibition of Nebulin-related Anchoring Protein (NRAP, Accession NM_006175), a gene which performs an anchoring function to link the terminal actin filaments of myofibrils to protein complexes located beneath the sarcolemma. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAP. The function of NRAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM649. Pinin, Desmosome

Associated Protein (PNN, Accession XM_048719) is another VGAM1315 host target gene. PNN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNN BINDING SITE, designated SEQ ID:35232, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46527] Another function of VGAM1315 is therefore inhibition of Pinin, Desmosome Associated Protein (PNN, Accession XM_048719), a gene which reinforces the intermediate filament-desmosome complex. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNN. The function of PNN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM_029842) is another VGAM1315 host target gene. PPT1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by PPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT1 BINDING SITE, designated SEQ ID:30955, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46528] Another function of VGAM1315 is therefore inhibition of Palmitoyl-protein Thioesterase 1 (ceroid-lipofuscinosis, neuronal 1, infantile) (PPT1, Accession XM_029842). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT1. Sorting Nexin 5 (SNX5, Accession NM_014426) is another VGAM1315 host target gene. SNX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX5 BINDING SITE, designated SEQ ID:15784, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46529] Another function of VGAM1315 is therefore inhibition of

Sorting Nexin 5 (SNX5, Accession NM_014426). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX5. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662) is another VGAM1315 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19195, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46530] Another function of VGAM1315 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical

cal conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM_000638) is another VGAM1315 host target gene. VTN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VTN BINDING SITE, designated SEQ ID:6272, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46531] Another function of VGAM1315 is therefore inhibition of Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM_000638), a gene which is a cell adhesion and spreading factor found in serum and tissues. Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTN. The function of VTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM850.Angiomotin (AMOT, Accession NM_133265) is another VGAM1315 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28413, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46532] Another function of VGAM1315 is therefore inhibition of Angiomotin (AMOT, Accession NM_133265). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 39 (DDX39, Accession NM_138998) is another VGAM1315 host target gene. DDX39 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX39 BINDING SITE, designated SEQ ID:29096, to the nucleotide se-

quence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46533] Another function of VGAM1315 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 39 (DDX39, Accession NM_138998). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX39. DKFZP434K2235 (Accession XM_096869) is another VGAM1315 host target gene. DKFZP434K2235 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434K2235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K2235 BINDING SITE, designated SEQ ID:40594, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46534] Another function of VGAM1315 is therefore inhibition of DKFZP434K2235 (Accession XM_096869). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K2235. DKFZP564O0423 (Accession

XM_166254) is another VGAM1315 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44063, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46535] Another function of VGAM1315 is therefore inhibition of DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787) is another VGAM1315 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16659, to the nucleotide

sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46536] Another function of VGAM1315 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM_014787). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 4 (DYRK4, Accession XM_034551) is another VGAM1315 host target gene. DYRK4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYRK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK4 BINDING SITE, designated SEQ ID:32122, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46537] Another function of VGAM1315 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 4 (DYRK4, Accession XM_034551). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DYRK4. EFA6R (Accession NM_015310) is another VGAM1315 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17624, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46538] Another function of VGAM1315 is therefore inhibition of EFA6R (Accession NM_015310). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. FBP17 (Accession XM_052666) is another VGAM1315 host target gene. FBP17 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FBP17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBP17 BINDING SITE, designated SEQ ID:36046, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ

ID:4026.

[46539] Another function of VGAM1315 is therefore inhibition of FBP17 (Accession XM_052666). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBP17. FLJ10420 (Accession NM_018090) is another VGAM1315 host target gene. FLJ10420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:19855, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46540] Another function of VGAM1315 is therefore inhibition of FLJ10420 (Accession NM_018090). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420. FLJ13409 (Accession NM_024617) is another VGAM1315 host target gene. FLJ13409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13409, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13409 BINDING SITE, designated SEQ ID:23878, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46541] Another function of VGAM1315 is therefore inhibition of FLJ13409 (Accession NM_024617). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13409. FLJ13782 (Accession NM_024915) is another VGAM1315 host target gene. FLJ13782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13782 BINDING SITE, designated SEQ ID:24437, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46542] Another function of VGAM1315 is therefore inhibition of FLJ13782 (Accession NM_024915). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13782. FLJ20343 (Accession NM_017775) is another VGAM1315 host target gene. FLJ20343 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20343 BINDING SITE, designated SEQ ID:19399, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46543] Another function of VGAM1315 is therefore inhibition of FLJ20343 (Accession NM_017775). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20343. FLJ21125 (Accession NM_024627) is another VGAM1315 host target gene. FLJ21125 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21125, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21125 BINDING SITE, designated SEQ ID:23891, to the nucleotide

sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46544] Another function of VGAM1315 is therefore inhibition of FLJ21125 (Accession NM_024627). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21125. FLJ22009 (Accession XM_015700) is another VGAM1315 host target gene. FLJ22009 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22009 BINDING SITE, designated SEQ ID:30243, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46545] Another function of VGAM1315 is therefore inhibition of FLJ22009 (Accession XM_015700). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22009. KIAA0987 (Accession NM_012307) is another VGAM1315 host target gene. KIAA0987 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0987 BINDING SITE, designated SEQ ID:14676, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46546] Another function of VGAM1315 is therefore inhibition of KIAA0987 (Accession NM_012307). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0987. MGC19556 (Accession NM_033551) is another VGAM1315 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27312, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46547] Another function of VGAM1315 is therefore inhibition of MGC19556 (Accession NM_033551). Accordingly, utilities

of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. VIT1 (Accession NM_018693) is another VGAM1315 host target gene. VIT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by VIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIT1 BINDING SITE, designated SEQ ID:20764, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46548] Another function of VGAM1315 is therefore inhibition of VIT1 (Accession NM_018693). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIT1. YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM_014263) is another VGAM1315 host target gene. YME1L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YME1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of YME1L1 BINDING SITE, designated SEQ ID:15535, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46549] Another function of VGAM1315 is therefore inhibition of YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM_014263). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YME1L1. LOC145483 (Accession XM_085156) is another VGAM1315 host target gene. LOC145483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145483 BINDING SITE, designated SEQ ID:37880, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46550] Another function of VGAM1315 is therefore inhibition of LOC145483 (Accession XM_085156). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145483. LOC147649 (Accession XM_085830) is another VGAM1315 host target gene. LOC147649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147649 BINDING SITE, designated SEQ ID:38356, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46551] Another function of VGAM1315 is therefore inhibition of LOC147649 (Accession XM_085830). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147649. LOC151443 (Accession XM_087200) is another VGAM1315 host target gene. LOC151443 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151443 BINDING SITE, designated SEQ ID:39115, to the nucleotide sequence of VGAM1315 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4026.

[46552] Another function of VGAM1315 is therefore inhibition of LOC151443 (Accession XM_087200). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151443. LOC167153 (Accession XM_094312) is another VGAM1315 host target gene. LOC167153 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC167153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC167153 BINDING SITE, designated SEQ ID:40229, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46553] Another function of VGAM1315 is therefore inhibition of LOC167153 (Accession XM_094312). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC167153. LOC220930 (Accession XM_167624) is another VGAM1315 host target gene. LOC220930 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220930, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:44735, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46554] Another function of VGAM1315 is therefore inhibition of LOC220930 (Accession XM_167624). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930. LOC220965 (Accession XM_166142) is another VGAM1315 host target gene. LOC220965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220965 BINDING SITE, designated SEQ ID:43946, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46555] Another function of VGAM1315 is therefore inhibition of LOC220965 (Accession XM_166142). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220965. LOC91286 (Accession XM_037444) is another VGAM1315 host target gene. LOC91286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91286 BINDING SITE, designated SEQ ID:32621, to the nucleotide sequence of VGAM1315 RNA, herein designated VGAM RNA, also designated SEQ ID:4026.

[46556] Another function of VGAM1315 is therefore inhibition of LOC91286 (Accession XM_037444). Accordingly, utilities of VGAM1315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1316 (VGAM1316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46557] VGAM1316 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1316 was detected is described hereinabove with reference to Figs. 1–8.

[46558] VGAM1316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus C. VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46559] VGAM1316 gene encodes a VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1316 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1316 precursor RNA is designated SEQ ID:1302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1302 is located at position 3523 relative to the genome of Foot-and-mouth Disease Virus C.

[46560] VGAM1316 precursor RNA folds onto itself, forming VGAM1316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1316 folded precursor RNA into VGAM1316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1316 RNA is designated SEQ ID:4027, and is provided hereinbelow with reference to the sequence listing part.

[46562] VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1316 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46563] VGAM1316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1316 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46564] The complementary binding of VGAM1316 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1316 host target RNA into VGAM1316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46565] It is appreciated that VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1316 host target genes. The mRNA of each one of this plurality of VGAM1316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1316 RNA, herein designated VGAM RNA, and which when bound by VGAM1316 RNA causes inhibition of translation of respective one or more VGAM1316 host target proteins.

[46566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1316 gene, herein designated VGAM GENE, on one or more VGAM1316 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46567] It is yet further appreciated that a function of VGAM1316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus C. Specific functions, and accordingly utilities, of VGAM1316 correlate with, and may be deduced from, the identity of the host target genes which VGAM1316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46568] Nucleotide sequences of the VGAM1316 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1316 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1316 are further described hereinbelow with reference to Table 1.

[46569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1316 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1316 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1316 gene, herein designated VGAM is inhibition of expression of VGAM1316 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1316 correlate with, and may be deduced from, the identity of the target genes which VGAM1316 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46571] Claudin 14 (CLDN14, Accession NM_144492) is a VGAM1316 host target gene. CLDN14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by CLDN14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN14 BINDING SITE, designated SEQ ID:29309, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46572] A function of VGAM1316 is therefore inhibition of Claudin 14 (CLDN14, Accession NM_144492), a gene which provides structural support for the auditory neuroepithelium. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN14. The function of CLDN14 has been established by previous studies. By sequencing the long arm of chromosome 21, Hattori et al. (2000) identified the CLDN14 gene. Using RACE, Wilcox et al. (2001) amplified a cDNA encoding CLDN14 from human liver cDNA. Comparison of the genomic chromosome 21 sequence with the cDNA sequence indicated that the CLDN14 gene contains 3 exons, and the authors identified 2 splice isoforms, one with and the other without exon 2. Northern blot analysis detected CLDN14 expression in liver and kidney. In situ hybridization and immunofluores-

cence studies revealed mouse Cldn14 expression in the sensory epithelium of the organ of Corti. By sequence analysis of chromosome 21q, Hattori et al. (2000) mapped the CLDN14 gene to 21q22.3. Wilcox et al. (2001) showed that the profound, congenital, recessive deafness segregating in 2 Pakistani families, PKSN6 and PKSR9a, defines a novel locus, DFNB29, on 21q22.1. These families supported maximum 2-point lod scores of 6.7 at theta of zero for the marker D21S1252 and 6.1 at theta of zero for marker D21S2079, respectively. Critical recombinants and homozygosity for polymorphic markers defined a DFNB29 linkage interval of 228,600 bp on 21q22.1. Since the CLDN14 gene maps within the critical interval and was considered a good candidate, Wilcox et al. (2001) examined the sequence of its single protein-coding exon. In affected individuals of family PKSN6, they identified a homozygous 1-bp deletion (398delT; 605608.0001), while in family PKSR9a they identified a val85-to-aspartic acid missense mutation (605608.0002). Val85 is conserved among 12 of the 20 claudins, while isoleucine is present among 5 claudins, and the remaining 3 claudins have either a cysteine or a proline at this position of the consensus molecule. Aspartic acid at position 85 was predicted to af-

fect hydrophobicity and disrupt the predicted secondary structures in transmembrane domain 2.

[46573] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46574] Hattori, M.; Fujiyama, A.; Taylor, T. D.; Watanabe, H.; Yada, T.; Park, H.-S.; Toyoda, A.; Ishii, K.; Totoki, Y.; Choi, D.-K.; Groner, Y.; Soeda, E.; and 52 others : The DNA sequence of human chromosome 21. Nature 405: 311–319, 2000. Note: Erratum: Nature: 407: 110 only, 2000. ; and

[46575] Wilcox, E. R.; Burton, Q. L.; Naz, S.; Riazuddin, S.; Smith, T. N.; Ploplis, B.; Belyatseva, I.; Ben-Yosef, T.; Liburd, N. A.; Morell, R. J.; Kachar, B.; Wu, D. K.; Griffith, A. J.; Ri.

[46576] Further studies establishing the function and utilities of CLDN14 are found in John Hopkins OMIM database record ID 605608, and in cited publications numbered 6766–6767 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ceroid–lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM_017882) is another VGAM1316 host target gene. CLN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN6, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN6 BINDING SITE, designated SEQ ID:19551, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46577] Another function of VGAM1316 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM_017882). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN6. C-terminal Binding Protein 1 (CTBP1, Accession XM_042659) is another VGAM1316 host target gene. CTBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTBP1 BINDING SITE, designated SEQ ID:33729, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46578] Another function of VGAM1316 is therefore inhibition of

C-terminal Binding Protein 1 (CTBP1, Accession XM_042659), a gene which binds to cellular and viral transcriptional repressors regulated by NAD⁺ and NADH. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTBP1. The function of CTBP1 has been established by previous studies. Polycomb (Pc) is part of a Pc group (PcG) protein complex that is involved in repression of gene activity during *Drosophila* and vertebrate development. Using a yeast 2-hybrid assay, Sewalt et al. (1999) found that *Xenopus* Ctbp1 interacts with *Xenopus* Pc and that human CTBP2 interacts with PC2 (OMIM Ref. No. 603079), a human Pc homolog. Immunofluorescence studies indicated that CTBP1 and CTBP2 partially colocalize with PC2 in large PcG domains in interphase nuclei. As with PC2, chimeric LexA-CTBP2 and LexA-CTBP1 proteins repressed gene activity when targeted to a reporter gene. Sewalt et al. (1999) suggested that PC2-mediated repression of gene expression involves an association with corepressors such as the CTBPs. They speculated that the interference of the adenoviral E1A protein with the transcription machinery of the infected cell may involve interference with PcG-mediated repres-

sion through disruption of the CTBP–PcG interaction.

Northern blot analysis revealed that the CTBP1 gene was expressed as a 2.4–kb mRNA in all human tissues tested. Zhang et al. (2002) demonstrated that CTBP binding to cellular and viral transcriptional repressors is regulated by NAD⁺ and NADH, with NADH being 2 to 3 orders of magnitude more effective. Levels of free nuclear nicotinamide adenine dinucleotides, determined using 2–photon microscopy, corresponded to the levels required for half-maximal CTBP binding and were considerably lower than those previously reported. Agents capable of increasing NADH levels stimulated CTBP binding to its partners in vivo and potentiated CTBP–mediated repression. Zhang et al. (2002) proposed that this ability to detect changes in nuclear NAD⁺/NADH ratio allows CTBP to serve as a redox sensor for transcription.

[46579] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46580] Sewalt, R. G. A. B.; Gunster, M. J.; van der Vlag, J.; Satijn, D. P. E.; Otte, A. P. : C-terminal binding protein is a transcriptional repressor that interacts with a specific class of vertebrate polycomb proteins. *Molec. Cell. Biol.* 19:

777-787, 1999. ; and

[46581] Zhang, Q.; Piston, D. W.; Goodman, R. H. : Regulation of corepressor function by nuclear NADH. Science 295: 1895-1897, 2002.

[46582] Further studies establishing the function and utilities of CTBP1 are found in John Hopkins OMIM database record ID 602618, and in cited publications numbered 8463-8468 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491) is another VGAM1316 host target gene. CXorf6 BINDING SITE1 and CXorf6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CXorf6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE1 and CXorf6 BINDING SITE2, designated SEQ ID:11993 and SEQ ID:11992 respectively, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46583] Another function of VGAM1316 is therefore inhibition of Chromosome X Open Reading Frame 6 (CXorf6, Accession

NM_005491). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf6. Dihydrofolate Reductase (DHFR, Accession NM_000791) is another VGAM1316 host target gene. DHFR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DHFR BINDING SITE, designated SEQ ID:6449, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46584] Another function of VGAM1316 is therefore inhibition of Dihydrofolate Reductase (DHFR, Accession NM_000791), a gene which converts dihydrofolate into tetrahydrofolate. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DHFR. The function of DHFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826.Folylpolyglutamate Synthase (FPGS, Accession

NM_004957) is another VGAM1316 host target gene. FPGS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FPGS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FPGS BINDING SITE, designated SEQ ID:11402, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46585] Another function of VGAM1316 is therefore inhibition of Folylpolyglutamate Synthase (FPGS, Accession NM_004957), a gene which is involved in conversion of folates to polyglutamate derivatives. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FPGS. The function of FPGS has been established by previous studies. By functional complementation of an *Escherichia coli* folC mutant, Garrow et al. (1992) cloned a human cDNA for folylpoly(γ -glutamate) synthetase (FPGS; tetrahydrofolate:L-glutamate γ -ligase (ADP forming); EC 6.3.2.17). The cDNA encodes a 545-residue protein of Mr 60,128. Expression of the cDNA in *E. coli* resulted in elevated expression of an enzyme with charac-

teristics of mammalian FPGS. Furthermore, expression of the cDNA in AUXB1, a mammalian cell lacking FPGS activity, overcame the cell's requirement for thymidine and purines but did not overcome the cell's glycine auxotrophy, consistent with expression of the protein in the cytosol but not in the mitochondria. Freemantle et al. (1995) proposed that the mitochondrial and cytosolic forms of FPGS are, in fact, derived from the same gene, arising from the use of the 2 different translation initiation codons, and that the translation products differ by the presence of a 42-residue amino-terminal mitochondrial leader peptide. Taylor et al. (1995) likewise concluded that a single locus encodes FPGS-related sequences in the human genome. The complete 2256 nucleotides of cDNA for the 5-prime untranslated region, mitochondrial leader sequence, coding region, and 3-prime untranslated region were found to be distributed on 15 exons stretching over 11.2 kb of genomic DNA.

[46586] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46587] Freemantle, S. J.; Taylor, S. M.; Krystal, G.; Moran, R. G. : Upstream organization of and multiple transcripts from

the human folylpoly- γ -glutamate synthetase gene.

J. Biol. Chem. 270: 9579-9584, 1995. ; and

[46588] Garrow, T. A.; Admon, A.; Shane, B. : Expression cloning of a human cDNA encoding folylpoly(γ -glutamate) synthetase and determination of its primary structure. Proc. Nat. Acad. Sci.

[46589] Further studies establishing the function and utilities of FPGS are found in John Hopkins OMIM database record ID 136510, and in cited publications numbered 11763-11771 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glypican 1 (GPC1, Accession NM_002081) is another VGAM1316 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7873, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46590] Another function of VGAM1316 is therefore inhibition of Glypican 1 (GPC1, Accession NM_002081), a gene which

may play a role in growth control and differentiation. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM125. Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM_005477) is another VGAM1316 host target gene. HCN4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCN4 BINDING SITE, designated SEQ ID:11978, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46591] Another function of VGAM1316 is therefore inhibition of Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM_005477), a gene which is hyperpolarization activated cyclic nucleotide-gated cation channel 4 and may act as a pace-

maker channel in the heart . Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCN4. The function of HCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Lymphotoxin Beta Receptor (TNFR superfamily, member 3) (LTBR, Accession NM_002342) is another VGAM1316 host target gene. LTBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTBR BINDING SITE, designated SEQ ID:8141, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46592] Another function of VGAM1316 is therefore inhibition of Lymphotoxin Beta Receptor (TNFR superfamily, member 3) (LTBR, Accession NM_002342), a gene which is a receptor for the heterotrimeric lymphotoxin containing lta and ltb, and for tnfs14/light. promotes apoptosis via traf3 and traf5. may play a role in the development of lymphoid or-

gans. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBR. The function of LTBR has been established by previous studies. Crowe et al. (1994) demonstrated that the tumor necrosis factor receptor related protein is the human receptor for the heterotrimer of lymphotoxin-alpha (OMIM Ref. No. 153440) and lymphotoxin-beta (OMIM Ref. No. 600978). This LT-alpha/LT-beta heterotrimer is assumed to take part in immunologic reactions by cell-cell contact, but does not bind to either TNFR1 (OMIM Ref. No. 191190) or TNFR2 (OMIM Ref. No. 191191). Nakamura et al. (1995) isolated the LT-beta receptor cDNA from a cDNA library of murine embryonic heart mRNA, using the signal sequence trap (SST) method, a newly developed strategy for cloning secreted proteins and type I membrane proteins (Tashiro et al., 1993). This method, which does not require specific functional assays, takes advantage of the fact that their precursors carry amino-terminal signal sequences. The deduced amino acid sequence of the mouse LT-beta receptor is 66% identical to that of the human protein. Northern analysis of various organs in adult mice have showed that expression levels of LTBR mRNA were strong

in lung, liver, and kidney, moderate in heart and testes, but weak in brain, thymus, spleen, and lymph nodes.

Nakamura et al. (1995) speculated that, since the mouse receptor was already expressed in 7 day-postcoitus embryos, the LT-alpha/LT-beta receptor system may have some function in early embryogenesis. By linkage analysis with recombinant inbred mouse strains, Nakamura et al. (1995) demonstrated that the locus, designated Tnfr, is very close to the Tnfr1 gene on mouse chromosome 6.

Presumably, the human homolog is located on 12p13

[46593] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46594] Crowe, P. D.; VanArsdale, T. L.; Walter, B. N.; Ware, C. F.; Hession, C.; Ehrenfels, B.; Browning, J. L.; Din, W. S.; Goodwin, R. G; Smith, C. A. : A lymphotoxin-beta-specific receptor. Science 264: 707-710, 1994. ; and

[46595] Nakamura, T.; Tashiro, K.; Nazarea, M.; Nakano, T.; Sasayama, S.; Honjo, T. : The murine lymphotoxin-beta receptor cDNA: isolation by the signal sequence trap and chromosomal mapping. Gen.

[46596] Further studies establishing the function and utilities of LTBR are found in John Hopkins OMIM database record ID

600979, and in cited publications numbered 7804–7806 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM_021075) is another VGAM1316 host target gene. NDUFV3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NDUFV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFV3 BINDING SITE, designated SEQ ID:22045, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46597] Another function of VGAM1316 is therefore inhibition of NADH Dehydrogenase (ubiquinone) Flavoprotein 3, 10kDa (NDUFV3, Accession NM_021075), a gene which transports electrons from NADH to ubiquinone. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFV3. The function of NDUFV3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to

VGAM626.6-phosphofructo-2-kinase/fructose-2,6-biphosphatase 4 (PFKFB4, Accession NM_004567) is another VGAM1316 host target gene. PFKFB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFKFB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFKFB4 BINDING SITE, designated SEQ ID:10909, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46598] Another function of VGAM1316 is therefore inhibition of 6-phosphofructo-2-kinase/fructose-2,6-bisphosphatase 4 (PFKFB4, Accession NM_004567), a gene which catalyzes synthesis and degradation of fructose 2,6-bisphosphate. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFKFB4. The function of PFKFB4 has been established by previous studies. The bifunctional 6-phosphofructo-2-kinase (EC 2.7.1.105)/fructose-2,6-bisphosphatase (EC 3.1.3.46) (PFKFB) regulates the steady-state concentration of fruc-

tose-2,6-bisphosphate, a potent activator of a key regulatory enzyme of glycolysis, phosphofructokinase.

Isozymes of PFKFB differ in the regions surrounding the catalytic core, which are important for the differential response to allosteric effectors and hormonal signals in different tissues. By screening a placental cDNA library with human and frog liver PFKFB (PFKFB1; 311790) as probes, Sakai et al. (1996) obtained a partial cDNA encoding PFKFB4, which they termed 2K-1. Manzano et al. (1999) isolated a cDNA encoding PFKFB4 by screening a human testis cDNA library with a rat liver Pfkfb probe, followed by RT-PCR. The predicted 469-amino acid PFKFB4 protein, which is 97% homologous to the rat sequence and approximately 70% identical to the human PFKFB isoforms, contains multiple phosphorylation sites. Northern blot analysis of rat brain, heart, liver, muscle, placenta, adipose tissue, ovary, fallopian tubes, and testis with the human PFKFB4 sequence as probe detected testis-specific expression of 2.4- and 3.3-kb transcripts. Western blot analysis showed expression of a 55-kD protein, close to the predicted value.

[46599] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [46600] Sakai, A.; Kato, M.; Fukasawa, M.; Ishiguro, M.; Furuya, E.; Sakakibara, R. : Cloning of cDNA encoding for a novel isozyme of fructose 6-phosphate,2-kinase/fructose 2,6-bisphosphatase from human placenta. J. Biochem. 119: 506-511, 1996. ; and
- [46601] Manzano, A.; Perez, J. X.; Nadal, M.; Estivill, X.; Lange, A.; Bartrons, R. : Cloning, expression and chromosomal localization of a human testis 6-phosphofructo-2-kinase/fructose-2,6-bis.
- [46602] Further studies establishing the function and utilities of PFKFB4 are found in John Hopkins OMIM database record ID 605320, and in cited publications numbered 4491 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TAL1 (SCL) Interrupting Locus (SIL, Accession NM_003035) is another VGAM1316 host target gene. SIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIL BINDING SITE, designated SEQ ID:8985, to the nucleotide sequence of

VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46603] Another function of VGAM1316 is therefore inhibition of TAL1 (SCL) Interrupting Locus (SIL, Accession NM_003035), a gene which may be required for axial development and left-right specification. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIL. The function of SIL has been established by previous studies. Aplan et al. (1997) demonstrated that transgenic mice in which inappropriately expressed scl protein, driven by sil regulatory elements, developed aggressive T-cell malignancies in collaboration with a mis-expressed LMO1 (OMIM Ref. No. 186921) protein, thus recapitulating the situation seen in a subset of human T-cell ALL. Aplan et al. (1997) also demonstrated that inappropriately expressed scl can interfere with the development of other tissues derived from mesoderm. Finally, Aplan et al. (1997) demonstrated that an scl construct lacking the scl transactivation domain collaborates with misexpressed LMO1, demonstrating that the scl transactivation domain is dispensable for oncogenesis, and supporting the hypothesis that the scl gene product exerts its

oncogenic action through a dominant-negative mechanism. Animal model experiments lend further support to the function of SIL. Izraeli et al. (1999) disrupted the Sil gene in mouse by homologous recombination. Heterozygotes were normal but mutant homozygotes died in utero after embryonic day 10.5. Between embryonic days 7.5 and 8.5, striking developmental anomalies appeared in Sil $-/-$ embryos. In addition to reduced size and limited developmental progress compared to wildtype embryos, Sil mutants displayed prominent midline neural tube defects. These included delay or failure of neural tube closure and holoprosencephaly (OMIM Ref. No. 236100). In addition, left-right development was abnormal. In heterozygous and wildtype embryos, the embryonic heart tube always loops to the right, whereas in Sil mutants the direction of heart looping is randomized. Nodal (OMIM Ref. No. 601265), lefty-2 (OMIM Ref. No. 603037) and Pitx2 (OMIM Ref. No. 601542) are normally expressed only in the left lateral-plate mesoderm before heart looping, with continued expression of Pitx2 on the left side of the looping heart tube. In contrast, Sil mutants showed bilaterally symmetric expression of nodal and Pitx2 at all stages examined. For lefty-2, most Sil $-/-$ embryos also showed bi-

laterally symmetric expression. However, a small number of mutants expressed lefty-2 only on the right. Expression of both Patched (OMIM Ref. No. 601309) and Gli1 (OMIM Ref. No. 165220) was greatly reduced in Sil -/- embryos. Shh (OMIM Ref. No. 600725) and Hnf3b (OMIM Ref. No. 600288) were expressed in the notochord of Sil mutants. However, the markedly reduced expression of their target genes indicated that Shh signaling in the midline may be blocked in Sil -/- embryos. Comparison with Shh mutant embryos, which have axial defects but normal cardiac looping, indicated that the consequences of abnormal midline development for left-right patterning depend on the time of onset, duration, and severity of disruption of the normal asymmetric patterns of expression of nodal, lefty-2, and Pitx2.

[46604] It is appreciated that the abovementioned animal model for SIL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[46605] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Ellsworth, M.; Wu, C.; McGuire, E. A.; Gross, K. W. : An scl gene product lacking the transactivation domain induces bony abnormalities and cooperates with LMO1 to generate T-cell malignancies in transgenic mice. EMBO J. 16: 2408–2419, 1997. ; and

[46607] Izraeli, S.; Lowe, L. A.; Bertness, V. L.; Good, D. J.; Dorward, D. W.; Kirsch, I. R.; Kuehn, M. R. : The SIL gene is required for mouse embryonic axial development and left-right spec.

[46608] Further studies establishing the function and utilities of SIL are found in John Hopkins OMIM database record ID 181590, and in cited publications numbered 12610–12615 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SRY (sex determining region Y)–box 4 (SOX4, Accession NM_003107) is another VGAM1316 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9072, to the nucleotide sequence of VGAM1316 RNA, herein

designated VGAM RNA, also designated SEQ ID:4027.

[46609] Another function of VGAM1316 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaaag-3' motif. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM1316 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR1 BINDING SITE, designated SEQ ID:11067, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46610] Another function of VGAM1316 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene

which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. TAF7 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 55kDa (TAF7, Accession NM_005642) is another VGAM1316 host target gene. TAF7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TAF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF7 BINDING SITE, designated SEQ ID:12176, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46611] Another function of VGAM1316 is therefore inhibition of TAF7 RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 55kDa (TAF7, Accession NM_005642), a gene which may function as a coactivator of transcription with some activators. Accordingly, utilities

of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF7. The function of TAF7 has been established by previous studies. Chiang and Roeder (1995) reported the cloning of a subunit of the TFIID protein complex (OMIM Ref. No. 313650) which is required for transcription by promoters targeted by RNA polymerase II. The TFIID complex binds to the TATA box in class II promoters and then recruits other factors as well as RNA polymerase II. TFIID is composed of the TATA-binding protein (TBP; 600075) and multiple TBP-associated factors (TAFs), one of which has a predicted size of 55 kD from SDS gel electrophoresis. The human TFIID subunit TAF2F (also referred to as TAFII55) was isolated from a cell line that expresses an epitope-tagged TBP allowing for the immunoprecipitation of the TFIID complex and associated factors. Based on partial peptide sequence of 1 TAF, Chiang and Roeder (1995) designed degenerate PCR primers and used them to produce a probe which was, in turn, hybridized to a human placenta cDNA library. The predicted protein is 349 amino acids (40 kD) and contains 40% charged residues, which may account for its larger than expected electrophoretic mobility. The mRNA was expressed in all

tissues examined. The authors showed that TAFII55 interacts with TAFII230, the largest subunit of TFIID, and with multiple transcription activators, including Sp1 (OMIM Ref. No. 189906), YY1 (OMIM Ref. No. 600013), USF (OMIM Ref. No. 191523), CTF (600729; discussed also in 164005), and adenoviral E1A (discussed in 607102). By genomic sequence analysis, Wu et al. (2001) determined that the mouse and human TAF2F genes contain a single exon.

[46612] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46613] Chiang, C.-M.; Roeder, R. G. : Cloning of an intrinsic human TFIID subunit that interacts with multiple transcriptional activators. *Science* 267: 531–536, 1995. ; and

[46615] Further studies establishing the function and utilities of TAF7 are found in John Hopkins OMIM database record ID 600573, and in cited publications numbered 9534–9535 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Thrombospondin 1 (THBS1, Accession NM_003246) is another VGAM1316 host target gene. THBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBS1 BINDING SITE, designated SEQ ID:9255, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46616] Another function of VGAM1316 is therefore inhibition of Thrombospondin 1 (THBS1, Accession NM_003246), a gene which is a member of a family of adhesive molecules, involves in blood clotting and in angiogenesis. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBS1. The function of THBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM20. Tuftelin 1 (TUFT1, Accession NM_020127) is another VGAM1316 host target gene. TUFT1 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by TUFT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:21316, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46617] Another function of VGAM1316 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM_020127), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUFT1. The function of TUFT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1152. A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 10 (ADAMTS10, Accession NM_030957) is another VGAM1316 host target gene. ADAMTS10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

ADAMTS10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS10 BINDING SITE, designated SEQ ID:25231, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46618] Another function of VGAM1316 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 10 (ADAMTS10, Accession NM_030957). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS10. BRAG (Accession NM_014863) is another VGAM1316 host target gene. BRAG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BRAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRAG BINDING SITE, designated SEQ ID:16942, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46619] Another function of VGAM1316 is therefore inhibition of

BRAG (Accession NM_014863). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRAG. DKFZP762D096 (Accession XM_037662) is another VGAM1316 host target gene. DKFZP762D096 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP762D096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP762D096 BINDING SITE, designated SEQ ID:32665, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46620] Another function of VGAM1316 is therefore inhibition of DKFZP762D096 (Accession XM_037662). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP762D096. FASTK (Accession NM_025096) is another VGAM1316 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24729, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46621] Another function of VGAM1316 is therefore inhibition of FASTK (Accession NM_025096). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK. FLJ10898 (Accession XM_002486) is another VGAM1316 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29894, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46622] Another function of VGAM1316 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10898. FLJ12800 (Accession NM_022903) is another VGAM1316 host target gene. FLJ12800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12800 BINDING SITE, designated SEQ ID:23192, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46623] Another function of VGAM1316 is therefore inhibition of FLJ12800 (Accession NM_022903). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12800. FLJ21709 (Accession XM_085480) is another VGAM1316 host target gene. FLJ21709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21709 BINDING SITE, designated SEQ ID:38168, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM

RNA, also designated SEQ ID:4027.

[46624] Another function of VGAM1316 is therefore inhibition of FLJ21709 (Accession XM_085480). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21709. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424) is another VGAM1316 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:15782, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46625] Another function of VGAM1316 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. KIAA0087 (Accession NM_014769) is another VGAM1316 host target gene. KIAA0087 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16556, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46626] Another function of VGAM1316 is therefore inhibition of KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0318 (Accession XM_044334) is another VGAM1316 host target gene. KIAA0318 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0318 BINDING SITE, designated SEQ ID:34188, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46627] Another function of VGAM1316 is therefore inhibition of

KIAA0318 (Accession XM_044334). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0318. KIAA0545 (Accession XM_032278) is another VGAM1316 host target gene. KIAA0545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:31636, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46628] Another function of VGAM1316 is therefore inhibition of KIAA0545 (Accession XM_032278). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545. KIAA1322 (Accession XM_052626) is another VGAM1316 host target gene. KIAA1322 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1322 BINDING SITE, designated SEQ ID:36028, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46629] Another function of VGAM1316 is therefore inhibition of KIAA1322 (Accession XM_052626). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1322. KIAA1719 (Accession XM_042936) is another VGAM1316 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33818, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46630] Another function of VGAM1316 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. KIAA1924 (Accession XM_057091) is another

VGAM1316 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36477, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46631] Another function of VGAM1316 is therefore inhibition of KIAA1924 (Accession XM_057091). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316) is another VGAM1316 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14688, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4027.

[46632] Another function of VGAM1316 is therefore inhibition of Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM_012316). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6. MGC10812 (Accession NM_031425) is another VGAM1316 host target gene. MGC10812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10812 BINDING SITE, designated SEQ ID:25413, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46633] Another function of VGAM1316 is therefore inhibition of MGC10812 (Accession NM_031425). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10812. MGC15827 (Accession NM_032882) is another VGAM1316 host target gene. MGC15827 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by MGC15827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15827 BINDING SITE, designated SEQ ID:26702, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46634] Another function of VGAM1316 is therefore inhibition of MGC15827 (Accession NM_032882). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15827. MR (Accession NM_031212) is another VGAM1316 host target gene. MR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MR BINDING SITE, designated SEQ ID:25255, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46635] Another function of VGAM1316 is therefore inhibition of MR (Accession NM_031212). Accordingly, utilities of

VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MR.

Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM1316 host target gene.

TRIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17600, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46636] Another function of VGAM1316 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. LOC199964 (Accession XM_117165) is another VGAM1316 host target gene. LOC199964 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199964 BINDING SITE, designated SEQ ID:43267, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46637] Another function of VGAM1316 is therefore inhibition of LOC199964 (Accession XM_117165). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199964. LOC199986 (Accession XM_117168) is another VGAM1316 host target gene. LOC199986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199986 BINDING SITE, designated SEQ ID:43273, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46638] Another function of VGAM1316 is therefore inhibition of LOC199986 (Accession XM_117168). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199986. LOC220549 (Accession XM_167521) is another VGAM1316 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44651, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46639] Another function of VGAM1316 is therefore inhibition of LOC220549 (Accession XM_167521). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC254532 (Accession XM_172961) is another VGAM1316 host target gene. LOC254532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254532 BINDING SITE, designated SEQ ID:46211, to the nucleotide sequence of VGAM1316 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4027.

[46640] Another function of VGAM1316 is therefore inhibition of LOC254532 (Accession XM_172961). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254532. LOC90917 (Accession XM_034861) is another VGAM1316 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32169, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46641] Another function of VGAM1316 is therefore inhibition of LOC90917 (Accession XM_034861). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. LOC91409 (Accession XM_038298) is another VGAM1316 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32801, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46642] Another function of VGAM1316 is therefore inhibition of LOC91409 (Accession XM_038298). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. LOC91948 (Accession XM_041723) is another VGAM1316 host target gene. LOC91948 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91948 BINDING SITE, designated SEQ ID:33572, to the nucleotide sequence of VGAM1316 RNA, herein designated VGAM RNA, also designated SEQ ID:4027.

[46643] Another function of VGAM1316 is therefore inhibition of LOC91948 (Accession XM_041723). Accordingly, utilities of VGAM1316 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91948. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1317 (VGAM1317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46644] VGAM1317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1317 was detected is described hereinabove with reference to Figs. 1–8.

[46645] VGAM1317 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46646] VGAM1317 gene encodes a VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1317 precursor RNA is desig-

nated SEQ ID:1303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1303 is located at position 1129 relative to the genome of Foot-and-mouth Disease Virus O.

- [46647] VGAM1317 precursor RNA folds onto itself, forming VGAM1317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46648] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1317 folded precursor RNA into VGAM1317 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1317 RNA is designated SEQ ID:4028, and is provided hereinbelow with reference to the sequence

listing part.

[46649] VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1317 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46650] VGAM1317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1317 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1317 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46651] The complementary binding of VGAM1317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1317 host target RNA into VGAM1317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46652] It is appreciated that VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1317 host target genes. The mRNA of each one of this plurality of VGAM1317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1317 RNA, herein designated VGAM

RNA, and which when bound by VGAM1317 RNA causes inhibition of translation of respective one or more VGAM1317 host target proteins.

[46653] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1317 gene, herein designated VGAM GENE, on one or more VGAM1317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46654] It is yet further appreciated that a function of VGAM1317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1317 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM1317 correlate with, and may be deduced from, the identity of the host target genes which VGAM1317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46655] Nucleotide sequences of the VGAM1317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1317 are further described hereinbelow with reference to Table 1.

[46656] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1317 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46657] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1317 gene, herein designated VGAM is

inhibition of expression of VGAM1317 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1317 correlate with, and may be deduced from, the identity of the target genes which VGAM1317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46658] Uncoupling Protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356) is a VGAM1317 host target gene. UCP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCP3 BINDING SITE, designated SEQ ID:9384, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46659] A function of VGAM1317 is therefore inhibition of Uncoupling Protein 3 (mitochondrial, proton carrier) (UCP3, Accession NM_003356), a gene which is a mitochondrial transporter protein that creates proton leaks across the inner mitochondrial membrane, thus uncoupling oxidative phosphorylation. Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with UCP3. The function of UCP3 has been established by previous studies. With the capacity to participate in thermogenesis and energy balance, UCP3 is an important obesity candidate gene.

Bouchard et al. (1997) demonstrated linkage between markers at the UCP2/UCP3 region with resting metabolic rate. This region is syntenic to a region of mouse chromosome 7 that has been linked to hyperinsulinemia and obesity (Fleury et al., 1997). Animal model experiments lend further support to the function of UCP3. Clapham et al. (2000) created transgenic mice that overexpress human UCP3 in skeletal muscle. UCP3 expression was driven by the human alpha-skeletal actin (OMIM Ref. No. 102610) promoter, limiting expression to skeletal muscle. Clapham et al. (2000) bred 3 independent lines to homozygosity and selected a line of mice that had a 66-fold increase in UCP3 expression. These mice were hyperphagic but weighed less than their wildtype littermates. Magnetic resonance imaging (MRI) showed a striking reduction in adipose tissue mass. The mice also exhibited lower fasting plasma glucose and insulin levels and an increased glucose clearance rate. Clapham et al. (2000) concluded that their data provided evidence that skeletal muscle

UCP3 has the potential to influence metabolic rates and glucose homeostasis in the whole animal.

[46660] It is appreciated that the abovementioned animal model for UCP3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[46661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46662] Clapham, J. C.; Arch, J. R. S.; Chapman, H.; Haynes, A.; Lister, C.; Moore, G. B. T.; Piercy, V.; Carter, S. A.; Lehner, I.; Smith, S. A.; Beeley, L. J.; Godden, R. J.; and 15 others : Mice overexpressing human uncoupling protein-3 in skeletal muscle are hyperphagic and lean. *Nature* 406: 415-418, 2000. ; and

[46663] Fleury, C.; Neverova, M.; Collins, S.; Raimbault, S.; Champigny, O.; Levi-Meyrueis, C.; Bouillaud, F.; Seldin, M. F.; Surwit, R. S.; Ricquier, D.; Warden, C. H. : Uncoupling protein-2.

[46664] Further studies establishing the function and utilities of UCP3 are found in John Hopkins OMIM database record ID 602044, and in cited publications numbered 6660-6662, 6484, 6663, 5960-5961, 3700, 6487, 6489, 8525-852

and 2794 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDC10 Cell Division Cycle 10 Homolog (*S. cerevisiae*) (CDC10, Accession XM_165879) is another VGAM1317 host target gene. CDC10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC10 BINDING SITE, designated SEQ ID:43792, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46665] Another function of VGAM1317 is therefore inhibition of CDC10 Cell Division Cycle 10 Homolog (*S. cerevisiae*) (CDC10, Accession XM_165879). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC10. FLJ10716 (Accession NM_018191) is another VGAM1317 host target gene. FLJ10716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10716 BINDING SITE, designated SEQ ID:20045, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46666] Another function of VGAM1317 is therefore inhibition of FLJ10716 (Accession NM_018191). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10716. KIAA0976 (Accession NM_014917) is another VGAM1317 host target gene. KIAA0976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17165, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46667] Another function of VGAM1317 is therefore inhibition of KIAA0976 (Accession NM_014917). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0976. KIAA1136 (Accession XM_166110) is another VGAM1317 host target gene. KIAA1136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1136 BINDING SITE, designated SEQ ID:43882, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46668] Another function of VGAM1317 is therefore inhibition of KIAA1136 (Accession XM_166110). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1136. Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM_003350) is another VGAM1317 host target gene. UBE2V2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2V2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2V2 BINDING SITE, designated SEQ ID:9375, to the nucleotide sequence of

VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46669] Another function of VGAM1317 is therefore inhibition of Ubiquitin-conjugating Enzyme E2 Variant 2 (UBE2V2, Accession NM_003350). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2V2.

LOC121274 (Accession XM_058547) is another VGAM1317 host target gene. LOC121274 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121274 BINDING SITE, designated SEQ ID:36655, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46670] Another function of VGAM1317 is therefore inhibition of LOC121274 (Accession XM_058547). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121274. LOC121536 (Accession XM_058567) is another VGAM1317 host target gene. LOC121536 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC121536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121536 BINDING SITE, designated SEQ ID:36662, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46671] Another function of VGAM1317 is therefore inhibition of LOC121536 (Accession XM_058567). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121536. LOC151201 (Accession XM_098021) is another VGAM1317 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:41319, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46672] Another function of VGAM1317 is therefore inhibition of

LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC152282 (Accession XM_087435) is another VGAM1317 host target gene. LOC152282 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152282 BINDING SITE, designated SEQ ID:39254, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46673] Another function of VGAM1317 is therefore inhibition of LOC152282 (Accession XM_087435). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152282. LOC254312 (Accession XM_172839) is another VGAM1317 host target gene. LOC254312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254312 BINDING SITE, designated SEQ ID:46114, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46674] Another function of VGAM1317 is therefore inhibition of LOC254312 (Accession XM_172839). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254312. LOC254413 (Accession XM_173141) is another VGAM1317 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46401, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46675] Another function of VGAM1317 is therefore inhibition of LOC254413 (Accession XM_173141). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC90288 (Accession XM_030669) is an-

other VGAM1317 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31107, to the nucleotide sequence of VGAM1317 RNA, herein designated VGAM RNA, also designated SEQ ID:4028.

[46676] Another function of VGAM1317 is therefore inhibition of LOC90288 (Accession XM_030669). Accordingly, utilities of VGAM1317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1318 (VGAM1318) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46677] VGAM1318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1318 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[46678] VGAM1318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46679] VGAM1318 gene encodes a VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1318 precursor RNA is designated SEQ ID:1304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1304 is located at position 7392 relative to the genome of Foot-and-mouth Disease Virus O.

[46680] VGAM1318 precursor RNA folds onto itself, forming VGAM1318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46681] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1318 folded precursor RNA into VGAM1318 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1318 RNA is designated SEQ ID:4029, and is provided hereinbelow with reference to the sequence listing part.

[46682] VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1318 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46683] VGAM1318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1318 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46684] The complementary binding of VGAM1318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1318 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1318 host target RNA into VGAM1318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46685] It is appreciated that VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1318 host target genes. The mRNA of each one of this plurality of VGAM1318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1318 RNA, herein designated VGAM RNA, and which when bound by VGAM1318 RNA causes inhibition of translation of respective one or more VGAM1318 host target proteins.

[46686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1318 gene, herein designated VGAM GENE, on one or more VGAM1318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46687] It is yet further appreciated that a function of VGAM1318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1318 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM1318 correlate with, and may be deduced from, the identity of the host target genes which VGAM1318 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46688] Nucleotide sequences of the VGAM1318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1318 are further described hereinbelow with reference to Table 1.

[46689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1318 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46690] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1318 gene, herein designated VGAM is inhibition of expression of VGAM1318 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1318 correlate with, and may be deduced from, the identity of the target genes which VGAM1318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46691] Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM_005667) is a VGAM1318 host target gene. ZFP103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFP103, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP103 BINDING SITE, designated SEQ ID:12220, to the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, also designated SEQ ID:4029.

[46692] A function of VGAM1318 is therefore inhibition of Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM_005667). Accordingly, utilities of VGAM1318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP103. FLJ11850 (Accession NM_022741) is another VGAM1318 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22953, to the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, also designated SEQ ID:4029.

[46693] Another function of VGAM1318 is therefore inhibition of FLJ11850 (Accession NM_022741). Accordingly, utilities of

VGAM1318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. FLJ20507 (Accession NM_017849) is another VGAM1318 host target gene. FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ20507, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20507 BINDING SITE1 and FLJ20507 BINDING SITE2, designated SEQ ID:19515 and SEQ ID:30223 respectively, to the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, also designated SEQ ID:4029.

[46694] Another function of VGAM1318 is therefore inhibition of FLJ20507 (Accession NM_017849). Accordingly, utilities of VGAM1318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20507. LOC126302 (Accession XM_059020) is another VGAM1318 host target gene. LOC126302 BINDING SITE1 through LOC126302 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC126302, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE1 through LOC126302 BINDING SITE3, designated SEQ ID:36820, SEQ ID:36821 and SEQ ID:36822 respectively, to the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, also designated SEQ ID:4029.

[46695] Another function of VGAM1318 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities of VGAM1318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC149703 (Accession XM_097719) is another VGAM1318 host target gene. LOC149703 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149703, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149703 BINDING SITE, designated SEQ ID:41063, to the nucleotide sequence of VGAM1318 RNA, herein designated VGAM RNA, also designated SEQ ID:4029.

[46696] Another function of VGAM1318 is therefore inhibition of LOC149703 (Accession XM_097719). Accordingly, utilities

of VGAM1318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149703. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1319 (VGAM1319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46697] VGAM1319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1319 was detected is described hereinabove with reference to Figs. 1-8.

[46698] VGAM1319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Foot-and-mouth Disease Virus O. VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46699] VGAM1319 gene encodes a VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1319 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1319 precursor RNA is designated SEQ ID:1305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1305 is located at position 6082 relative to the genome of Foot-and-mouth Disease Virus O.

- [46700] VGAM1319 precursor RNA folds onto itself, forming VGAM1319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46701] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1319 folded precursor RNA into VGAM1319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1319 RNA is designated SEQ ID:4030, and

is provided hereinbelow with reference to the sequence listing part.

[46702] VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1319 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[46703] VGAM1319 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1319 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46704] The complementary binding of VGAM1319 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1319 host target RNA into VGAM1319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46705] It is appreciated that VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1319 host target genes. The mRNA of each one of this plurality of VGAM1319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1319 RNA, herein designated VGAM RNA, and which when bound by VGAM1319 RNA causes inhibition of translation of respective one or more VGAM1319 host target proteins.

[46706] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1319 gene, herein designated VGAM GENE, on one or more VGAM1319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46707] It is yet further appreciated that a function of VGAM1319 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of viral infection by Foot-and-mouth Disease Virus O. Specific functions, and accordingly utilities, of VGAM1319 correlate with, and may be deduced from, the identity of the host target genes which VGAM1319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46708] Nucleotide sequences of the VGAM1319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1319 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1319 are further described hereinbelow with reference to Table 1.

[46709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1319 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46710] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1319 gene, herein designated VGAM is inhibition of expression of VGAM1319 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1319 correlate with, and may be deduced from, the identity of the target genes which VGAM1319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46711] Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332) is a VGAM1319 host target gene. ANKTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKTM1 BINDING SITE, designated SEQ ID:14254, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46712] A function of VGAM1319 is therefore inhibition of Ankyrin-like with Transmembrane Domains 1 (ANKTM1, Accession NM_007332), a gene which attaches integral membrane proteins to cytoskeletal elements. Accordingly, utilities of VGAM1319 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with ANKTM1. The function of ANKTM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Growth Arrest-specific 11 (GAS11, Accession NM_001481) is another VGAM1319 host target gene. GAS11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAS11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAS11 BINDING SITE, designated SEQ ID:7221, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46713] Another function of VGAM1319 is therefore inhibition of Growth Arrest-specific 11 (GAS11, Accession NM_001481). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS11. LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055) is another VGAM1319 host target gene. LANCL1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LANCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL1 BINDING SITE, designated SEQ ID:12695, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46714] Another function of VGAM1319 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 1 (bacterial) (LANCL1, Accession NM_006055), a gene which binds the C-terminus of stomatin. Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL1. The function of LANCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM656. Microtubule-associated Protein Tau (MAPT, Accession NM_005910) is another VGAM1319 host target gene. MAPT BINDING SITE1 through MAPT BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPT, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPT BINDING SITE1 through MAPT BINDING SITE4, designated SEQ ID:12539, SEQ ID:18827, SEQ ID:18833 and SEQ ID:18839 respectively, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46715] Another function of VGAM1319 is therefore inhibition of Microtubule-associated Protein Tau (MAPT, Accession NM_005910), a gene which Microtubule-associated protein tau; promotes microtubule assembly. Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPT. The function of MAPT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Neurexin 2 (NRXN2, Accession NM_138734) is another VGAM1319 host target gene. NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NRXN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of NRXN2 BINDING SITE1 through NRXN2 BINDING SITE3, designated SEQ ID:28990, SEQ ID:17468 and SEQ ID:8667 respectively, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46716] Another function of VGAM1319 is therefore inhibition of Neurexin 2 (NRXN2, Accession NM_138734), a gene which may be involved in cell recognition, cell adhesion, and may mediate intracellular signaling. Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRXN2. The function of NRXN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.FLJ20584 (Accession NM_017891) is another VGAM1319 host target gene. FLJ20584 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20584 BINDING SITE, designated SEQ ID:19558, to the nucleotide sequence of VGAM1319 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4030.

[46717] Another function of VGAM1319 is therefore inhibition of FLJ20584 (Accession NM_017891). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20584. FLJ20699 (Accession NM_017931) is another VGAM1319 host target gene. FLJ20699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20699 BINDING SITE, designated SEQ ID:19616, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46718] Another function of VGAM1319 is therefore inhibition of FLJ20699 (Accession NM_017931). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20699. KIAA0603 (Accession NM_014832) is another VGAM1319 host target gene. KIAA0603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0603, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0603 BINDING SITE, designated SEQ ID:16830, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46719] Another function of VGAM1319 is therefore inhibition of KIAA0603 (Accession NM_014832). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0603. KIAA1399 (Accession XM_046685) is another VGAM1319 host target gene. KIAA1399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1399 BINDING SITE, designated SEQ ID:34797, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46720] Another function of VGAM1319 is therefore inhibition of KIAA1399 (Accession XM_046685). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1399. KIAA1404 (Accession XM_030494) is another VGAM1319 host target gene. KIAA1404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1404 BINDING SITE, designated SEQ ID:31049, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46721] Another function of VGAM1319 is therefore inhibition of KIAA1404 (Accession XM_030494). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1404. WIT-1 (Accession NM_015855) is another VGAM1319 host target gene. WIT-1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WIT-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WIT-1 BINDING SITE, designated SEQ ID:17988, to the nucleotide sequence of

VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46722] Another function of VGAM1319 is therefore inhibition of WIT-1 (Accession NM_015855). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WIT-1. LOC197342 (Accession XM_113869) is another VGAM1319 host target gene. LOC197342 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197342 BINDING SITE, designated SEQ ID:42486, to the nucleotide sequence of VGAM1319 RNA, herein designated VGAM RNA, also designated SEQ ID:4030.

[46723] Another function of VGAM1319 is therefore inhibition of LOC197342 (Accession XM_113869). Accordingly, utilities of VGAM1319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197342. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1320 (VGAM1320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46724] VGAM1320 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1320 was detected is described hereinabove with reference to Figs. 1–8.

[46725] VGAM1320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46726] VGAM1320 gene encodes a VGAM1320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1320 precursor RNA is designated SEQ ID:1306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1306 is located at position 221058 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[46727] VGAM1320 precursor RNA folds onto itself, forming VGAM1320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46728] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1320 folded precursor RNA into VGAM1320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1320 RNA is designated SEQ ID:4031, and is provided hereinbelow with reference to the sequence listing part.

[46729] VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1320 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1320 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46730] VGAM1320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1320 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46731] The complementary binding of VGAM1320 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1320 host target RNA into VGAM1320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46732] It is appreciated that VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1320 host target genes. The mRNA of each one of this plurality of VGAM1320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1320 RNA, herein designated VGAM RNA, and which when bound by VGAM1320 RNA causes inhibition of translation of respective one or more VGAM1320 host target proteins.

[46733] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1320 gene, herein designated VGAM GENE, on one or more VGAM1320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46734] It is yet further appreciated that a function of VGAM1320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1320 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1320 correlate with, and may be deduced from,

the identity of the host target genes which VGAM1320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46735] Nucleotide sequences of the VGAM1320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1320 are further described hereinbelow with reference to Table 1.

[46736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1320 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46737] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1320 gene, herein designated VGAM is inhibition of expression of VGAM1320 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1320 correlate with, and may be deduced from, the identity of the target genes which VGAM1320

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46738] Histidine Ammonia-lyase (HAL, Accession NM_002108) is a VGAM1320 host target gene. HAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAL BINDING SITE, designated SEQ ID:7886, to the nucleotide sequence of VGAM1320 RNA, herein designated VGAM RNA, also designated SEQ ID:4031.

[46739] A function of VGAM1320 is therefore inhibition of Histidine Ammonia-lyase (HAL, Accession NM_002108). Accordingly, utilities of VGAM1320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAL. TSG (Accession NM_020648) is another VGAM1320 host target gene. TSG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSG BINDING

SITE, designated SEQ ID:21809, to the nucleotide sequence of VGAM1320 RNA, herein designated VGAM RNA, also designated SEQ ID:4031.

[46740] Another function of VGAM1320 is therefore inhibition of TSG (Accession NM_020648). Accordingly, utilities of VGAM1320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSG. BCMP1 (Accession NM_031442) is another VGAM1320 host target gene. BCMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25453, to the nucleotide sequence of VGAM1320 RNA, herein designated VGAM RNA, also designated SEQ ID:4031.

[46741] Another function of VGAM1320 is therefore inhibition of BCMP1 (Accession NM_031442). Accordingly, utilities of VGAM1320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 1321 (VGAM1321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46742] VGAM1321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1321 was detected is described hereinabove with reference to Figs. 1–8.

[46743] VGAM1321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melanoplus Sanguinipes Entomopoxvirus. VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46744] VGAM1321 gene encodes a VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1321 precursor RNA is designated SEQ ID:1307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1307 is located at position 223345 relative to the genome of Melanoplus Sanguinipes Entomopoxvirus.

[46745] VGAM1321 precursor RNA folds onto itself, forming VGAM1321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46746] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1321 folded precursor RNA into VGAM1321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1321 RNA is designated SEQ ID:4032, and is provided hereinbelow with reference to the sequence listing part.

[46747] VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1321 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1321 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46748] VGAM1321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1321 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46749] The complementary binding of VGAM1321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1321 host target RNA into VGAM1321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46750] It is appreciated that VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1321 host target genes. The mRNA of each one of this plurality of VGAM1321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1321 RNA, herein designated VGAM RNA, and which when bound by VGAM1321 RNA causes inhibition of translation of respective one or more VGAM1321 host target proteins.

[46751] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1321 gene, herein designated VGAM GENE, on one or more VGAM1321 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46752] It is yet further appreciated that a function of VGAM1321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of viral infection by Melanoplus Sanguinipes Entomopoxvirus. Specific functions, and accordingly utilities, of VGAM1321 correlate with, and may be deduced from,

the identity of the host target genes which VGAM1321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46753] Nucleotide sequences of the VGAM1321 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1321 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1321 are further described hereinbelow with reference to Table 1.

[46754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1321 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1321 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46755] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1321 gene, herein designated VGAM is inhibition of expression of VGAM1321 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1321 correlate with, and may be deduced from, the identity of the target genes which VGAM1321

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46756] Cyclin D2 (CCND2, Accession NM_001759) is a VGAM1321 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7511, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46757] A function of VGAM1321 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the G1/S (start) transition. Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128. Chloride Channel, Calcium Activated, Family Member 2 (CLCA2, Accession NM_006536) is another

VGAM1321 host target gene. CLCA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCA2 BINDING SITE, designated SEQ ID:13289, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46758] Another function of VGAM1321 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 2 (CLCA2, Accession NM_006536), a gene which Calcium-sensitive chloride channel, is suggested to play a role in the complex pathogenesis of cystic fibrosis. Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCA2. The function of CLCA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM851. M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195) is another VGAM1321 host target gene. MPHOSPH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MPHOSPH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPHOSPH1 BINDING SITE, designated SEQ ID:18286, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46759] Another function of VGAM1321 is therefore inhibition of M-phase Phosphoprotein 1 (MPHOSPH1, Accession NM_016195), a gene which is Phosphorylated during M-phase and interacts with guanosine triphosphate. Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPHOSPH1. The function of MPHOSPH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_001716) is another VGAM1321 host target gene. BLR1 BINDING SITE1 and BLR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLR1, corresponding to HOST TARGET binding sites such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLR1 BINDING SITE1 and BLR1 BINDING SITE2, designated SEQ ID:7446 and SEQ ID:26776 respectively, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46760] Another function of VGAM1321 is therefore inhibition of Burkitt Lymphoma Receptor 1, GTP Binding Protein (chemokine (C-X-C motif) Receptor 5) (BLR1, Accession NM_001716). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLR1. Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119) is another VGAM1321 host target gene. DNCLI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNCLI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNCLI1 BINDING SITE, designated SEQ ID:29928, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46761] Another function of VGAM1321 is therefore inhibition of Dynein, Cytoplasmic, Light Intermediate Polypeptide 1 (DNCLI1, Accession XM_003119). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCLI1. KIAA0644 (Accession NM_014817) is another VGAM1321 host target gene. KIAA0644 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0644 BINDING SITE, designated SEQ ID:16781, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46762] Another function of VGAM1321 is therefore inhibition of KIAA0644 (Accession NM_014817). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0644. M96 (Accession NM_007358) is another VGAM1321 host target gene. M96 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by M96, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M96 BINDING SITE, designated SEQ ID:14288, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46763] Another function of VGAM1321 is therefore inhibition of M96 (Accession NM_007358). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M96. MIG-6 (Accession NM_018948) is another VGAM1321 host target gene. MIG-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIG-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIG-6 BINDING SITE, designated SEQ ID:21018, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46764] Another function of VGAM1321 is therefore inhibition of MIG-6 (Accession NM_018948). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MIG-6. MRPL56 (Accession NM_032857) is another VGAM1321 host target gene. MRPL56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL56 BINDING SITE, designated SEQ ID:26658, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46765] Another function of VGAM1321 is therefore inhibition of MRPL56 (Accession NM_032857). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL56. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is another VGAM1321 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ

ID:21901, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46766] Another function of VGAM1321 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. LOC116068 (Accession XM_057302) is another VGAM1321 host target gene. LOC116068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116068 BINDING SITE, designated SEQ ID:36499, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46767] Another function of VGAM1321 is therefore inhibition of LOC116068 (Accession XM_057302). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116068. LOC51141 (Accession XM_043953) is an-

other VGAM1321 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34050, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46768] Another function of VGAM1321 is therefore inhibition of LOC51141 (Accession XM_043953). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. LOC92249 (Accession XM_043814) is another VGAM1321 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34017, to the nucleotide sequence of VGAM1321 RNA, herein designated VGAM RNA, also designated SEQ ID:4032.

[46769] Another function of VGAM1321 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM1321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1322 (VGAM1322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46770] VGAM1322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1322 was detected is described hereinabove with reference to Figs. 1-8.

[46771] VGAM1322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus. VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46772] VGAM1322 gene encodes a VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1322 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1322 precursor RNA is designated SEQ ID:1308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1308 is located at position 5259 relative to the genome of Garlic Latent Virus.

[46773] VGAM1322 precursor RNA folds onto itself, forming VGAM1322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46774] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1322 folded precursor RNA into VGAM1322 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1322 RNA is designated SEQ ID:4033, and is provided hereinbelow with reference to the sequence listing part.

[46775] VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1322 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[46776] VGAM1322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1322 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[46777] The complementary binding of VGAM1322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1322 host target RNA into VGAM1322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46778] It is appreciated that VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1322 host target genes. The mRNA of each one of this plurality of VGAM1322 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1322 RNA, herein designated VGAM RNA, and which when bound by VGAM1322 RNA causes inhibition of translation of respective one or more VGAM1322 host target proteins.

[46779] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1322 gene, herein designated VGAM GENE, on one or more VGAM1322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46780] It is yet further appreciated that a function of VGAM1322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1322 correlate with, and may be deduced from, the identity of the host target genes which VGAM1322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46781] Nucleotide sequences of the VGAM1322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1322 are further described hereinbelow with reference to Table 1.

[46782] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1322 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1322 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[46783] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1322 gene, herein designated VGAM is inhibition of expression of VGAM1322 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1322 correlate with, and may be deduced from, the identity of the target genes which VGAM1322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46784] Alpha-1-B Glycoprotein (A1BG, Accession NM_130786) is a VGAM1322 host target gene. A1BG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by A1BG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A1BG BINDING SITE, designated SEQ ID:28275, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46785] A function of VGAM1322 is therefore inhibition of Alpha-1-B Glycoprotein (A1BG, Accession NM_130786), a gene which a plasma protein of unknown function. Accordingly, utilities of VGAM1322 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with A1BG. The function of A1BG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172. Aryl Hydrocarbon Receptor (AHR, Accession NM_001621) is another VGAM1322 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7331, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46786] Another function of VGAM1322 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM368.ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052) is another VGAM1322 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5490, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46787] Another function of VGAM1322 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM_000052). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Calpain 10 (CAPN10, Accession NM_023084) is another VGAM1322 host target gene. CAPN10 BINDING SITE1 through CAPN10 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CAPN10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN10 BINDING SITE1 through CAPN10 BINDING SITE4, designated SEQ ID:23346, SEQ ID:23348, SEQ ID:23350 and SEQ ID:23352 respectively, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46788] Another function of VGAM1322 is therefore inhibition of Calpain 10 (CAPN10, Accession NM_023084), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal transduction. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Cytochrome P450, Subfamily VIIB (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM1322 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10621, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46789] Another function of VGAM1322 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366) is another VGAM1322 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42239, to the nucleotide

sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46790] Another function of VGAM1322 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193) is another VGAM1322 host target gene. FZD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD4 BINDING SITE, designated SEQ ID:14482, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46791] Another function of VGAM1322 is therefore inhibition of

Frizzled Homolog 4 (Drosophila) (FZD4, Accession NM_012193), a gene which may function in cell polarity, cell fate specification and cancer; similar to frizzled receptor family, has seven transmembrane domains. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD4. The function of FZD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM309. Male Germ Cell-associated Kinase (MAK, Accession NM_005906) is another VGAM1322 host target gene. MAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAK BINDING SITE, designated SEQ ID:12527, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46792] Another function of VGAM1322 is therefore inhibition of Male Germ Cell-associated Kinase (MAK, Accession NM_005906), a gene which plays an important role in

spermatogenesis. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAK. The function of MAK has been established by previous studies. Male germ cell-associated kinase is one of the protein kinases that was isolated by weak cross-hybridization with the v-ros (OMIM Ref. No. 165020) protein kinase sequence (Matsushime et al., 1990). The gene encoding this kinase is expressed almost exclusively in testis, mainly in germ cells at and/or after the pachytene stage, as 66- and 60-kD proteins that form a distinct complex with cellular phosphoprotein p210. The p210 protein is sufficiently phosphorylated in vitro by the MAK gene product at serine and threonine residues. These results suggest that the MAK gene plays an important role in spermatogenesis. Using a panel of DNA samples from an interspecific cross, Taketo et al. (1994) mapped the Mak gene to mouse chromosome 13 in an area situated between 2 regions that are homologous with human chromosome 6p and chromosome 5. Taketo et al. (1994) stated that preliminary Southern analysis of DNA samples from a panel of mouse/human somatic cell hybrids showed concordant hybridization of the MAK gene and the ROS1 gene, previ-

ously mapped to 6q22

[46793] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46794] Matsushime, H.; Jinno, A.; Takagi, N.; Shibuya, M. : A novel mammalian protein kinase gene (mak) is highly expressed in testicular germ cells at and after meiosis. Molec. Cell. Biol. 10: 2261–2268, 1990. ; and

[46795] Taketo, M.; Jinno, A.; Yamaguchi, S.; Matsushime, H.; Shibuya, M.; Seldin, M. F. : Mouse Mak gene for male germ cell-associated kinase maps to chromosome 13. Genomics 19: 397–398, 1994.

[46796] Further studies establishing the function and utilities of MAK are found in John Hopkins OMIM database record ID 154235, and in cited publications numbered 2196–2197 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mediterranean Fever (MEFV, Accession NM_000243) is another VGAM1322 host target gene. MEFV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEFV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:5767, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46797] Another function of VGAM1322 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM_000243). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. Melan-A (MLANA, Accession NM_005511) is another VGAM1322 host target gene. MLANA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLANA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLANA BINDING SITE, designated SEQ ID:12027, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46798] Another function of VGAM1322 is therefore inhibition of Melan-A (MLANA, Accession NM_005511). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MLANA. Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139) is another VGAM1322 host target gene. MS4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:5634, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46799] Another function of VGAM1322 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM362. Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688) is another VGAM1322 host target gene.

NONO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NONO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NONO BINDING SITE, designated SEQ ID:39898, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46800] Another function of VGAM1322 is therefore inhibition of Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688), a gene which is a nuclear protein which contains RNA recognition motifs. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NONO. The function of NONO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Period Homolog 2 (Drosophila) (PER2, Accession NM_022817) is another VGAM1322 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23087, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46801] Another function of VGAM1322 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Rhesus Blood Group, D Antigen (RHD, Accession NM_016124) is another VGAM1322 host target gene. RHD BINDING SITE1 and RHD BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:18216 and SEQ ID:18336 respectively, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46802] Another function of VGAM1322 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM_016124), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM1322 host target gene. SEDL BINDING SITE1 and SEDL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SEDL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE1 and SEDL BINDING SITE2, designated SEQ ID:15906 and SEQ ID:32987 respectively, to the nucleotide sequence of

VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46803] Another function of VGAM1322 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM1322 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9177, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46804] Another function of VGAM1322 is therefore inhibition of

TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAPBP. The function of TAPBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM122. Teratocarcinoma-derived Growth Factor 1 (TDGF1, Accession NM_003212) is another VGAM1322 host target gene. TDGF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TDGF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TDGF1 BINDING SITE, designated SEQ ID:9208, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46805] Another function of VGAM1322 is therefore inhibition of Teratocarcinoma-derived Growth Factor 1 (TDGF1, Accession NM_003212), a gene which can play a role in the determination of the epiblastic cells that subsequently give

rise to the mesoderm. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TDGF1. The function of TDGF1 has been established by previous studies. Cryptic protein is required for proper laterality development in humans. TDGF1, like CFC1, is an EGF-CFC family member and an obligate coreceptor involved in NODAL signaling, a developmental program implicated in midline, forebrain, and left-right axis development in model organisms. A mutation in the conserved CFC domain of the TDGF1 gene (187395.0001) was demonstrated by de la Cruz et al. (2002) in a patient with midline anomalies of the forebrain. The mutant protein was inactive in a zebrafish rescue assay, indicating a role for TDGF1 in human midline and forebrain development. From a teratocarcinoma cell line, Ciccodicola et al. (1989) isolated a human cDNA (referred to as CRIPTO by them) encoding a protein of 188 amino acids. The central portion of this protein shared structural similarities with the human transforming growth factor alpha (OMIM Ref. No. 190170) and epidermal growth factor (EGF; 131530). Northern blot analysis of a wide variety of tumor and normal cell lines and tissues showed that CRIPTO transcripts are detected only in un-

differentiated cells and disappear after cell differentiation induced by retinoic acid treatment.

[46806] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46807] de la Cruz, J. M.; Bamford, R. N.; Burdine, R. D.; Roessler, E.; Barkovich, A. J.; Donnai, D.; Schier, A. F.; Muenke, M. : A loss-of-function mutation in the CFC domain of TDGF1 is associated with human forebrain defects. Hum. Genet. 110: 422–428, 2002. ; and

[46808] Ciccodicola, A.; Dono, R.; Obici, S.; Simeone, A.; Zollo, M.; Persico, M. G. : Molecular characterization of a gene of the 'EGF family' expressed in undifferentiated human NTERA2 terato.

[46809] Further studies establishing the function and utilities of TDGF1 are found in John Hopkins OMIM database record ID 187395, and in cited publications numbered 593–600 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842) is another VGAM1322 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:9935, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46810] Another function of VGAM1322 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM400. Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727) is another VGAM1322 host target gene. TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRPV1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II

or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPV1 BINDING SITE1 through TRPV1 BINDING SITE4, designated SEQ ID:20810, SEQ ID:27990, SEQ ID:27998 and SEQ ID:28006 respectively, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46811] Another function of VGAM1322 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily V, Member 1 (TRPV1, Accession NM_018727), a gene which functions as a receptor for capsaicin. Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPV1. The function of TRPV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM146. Zinc Finger Protein 264 (ZNF264, Accession NM_003417) is another VGAM1322 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ZNF264 BINDING SITE, designated SEQ ID:9453, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46812] Another function of VGAM1322 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM_003417). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. ARPP-19 (Accession NM_006628) is another VGAM1322 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13418, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46813] Another function of VGAM1322 is therefore inhibition of ARPP-19 (Accession NM_006628). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-

19. ASE-1 (Accession NM_012099) is another VGAM1322 host target gene. ASE-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASE-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASE-1 BINDING SITE, designated SEQ ID:14403, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46814] Another function of VGAM1322 is therefore inhibition of ASE-1 (Accession NM_012099). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASE-1. BA108L7.2 (Accession NM_030971) is another VGAM1322 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:25235, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA,

also designated SEQ ID:4033.

[46815] Another function of VGAM1322 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. BICD2 (Accession XM_046863) is another VGAM1322 host target gene. BICD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BICD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BICD2 BINDING SITE, designated SEQ ID:34850, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46816] Another function of VGAM1322 is therefore inhibition of BICD2 (Accession XM_046863). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BICD2. Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456) is another VGAM1322 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21689, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46817] Another function of VGAM1322 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM_020456). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956) is another VGAM1322 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21023, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46818] Another function of VGAM1322 is therefore inhibition of

Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. Claudin 15 (CLDN15, Accession NM_138429) is another VGAM1322 host target gene. CLDN15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN15 BINDING SITE, designated SEQ ID:28791, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46819] Another function of VGAM1322 is therefore inhibition of Claudin 15 (CLDN15, Accession NM_138429). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN15. DCOHM (Accession NM_032151) is another VGAM1322 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25841, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46820] Another function of VGAM1322 is therefore inhibition of DCOHM (Accession NM_032151). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. FLJ10232 (Accession NM_018033) is another VGAM1322 host target gene. FLJ10232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:19772, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46821] Another function of VGAM1322 is therefore inhibition of FLJ10232 (Accession NM_018033). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10232. FLJ10535 (Accession NM_018129) is another VGAM1322 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:19916, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46822] Another function of VGAM1322 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10922 (Accession NM_018273) is another VGAM1322 host target gene. FLJ10922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10922 BINDING SITE, designated SEQ ID:20253, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM

RNA, also designated SEQ ID:4033.

[46823] Another function of VGAM1322 is therefore inhibition of FLJ10922 (Accession NM_018273). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10922. FLJ12572 (Accession NM_022905) is another VGAM1322 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23196, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46824] Another function of VGAM1322 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ14642 (Accession NM_032818) is another VGAM1322 host target gene. FLJ14642 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14642, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14642 BINDING SITE, designated SEQ ID:26593, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46825] Another function of VGAM1322 is therefore inhibition of FLJ14642 (Accession NM_032818). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14642. FLJ20136 (Accession NM_017684) is another VGAM1322 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19227, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46826] Another function of VGAM1322 is therefore inhibition of FLJ20136 (Accession NM_017684). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20136. FLJ20344 (Accession NM_017776) is another VGAM1322 host target gene. FLJ20344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:19403, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46827] Another function of VGAM1322 is therefore inhibition of FLJ20344 (Accession NM_017776). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344. FLJ20452 (Accession NM_017828) is another VGAM1322 host target gene. FLJ20452 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20452 BINDING SITE, designated SEQ ID:19490, to the nucleotide

sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46828] Another function of VGAM1322 is therefore inhibition of FLJ20452 (Accession NM_017828). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20452. FLJ23356 (Accession NM_032237) is another VGAM1322 host target gene. FLJ23356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23356 BINDING SITE, designated SEQ ID:25957, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46829] Another function of VGAM1322 is therefore inhibition of FLJ23356 (Accession NM_032237). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23356. FLJ23563 (Accession XM_041701) is another VGAM1322 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33559, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46830] Another function of VGAM1322 is therefore inhibition of FLJ23563 (Accession XM_041701). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. FLJ30532 (Accession NM_144724) is another VGAM1322 host target gene. FLJ30532 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30532, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30532 BINDING SITE, designated SEQ ID:29547, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46831] Another function of VGAM1322 is therefore inhibition of FLJ30532 (Accession NM_144724). Accordingly, utilities of

VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30532. FLJ31153 (Accession NM_144600) is another VGAM1322 host target gene. FLJ31153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ31153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:29412, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46832] Another function of VGAM1322 is therefore inhibition of FLJ31153 (Accession NM_144600). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153. GRWD (Accession NM_031485) is another VGAM1322 host target gene. GRWD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRWD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRWD BINDING SITE,

designated SEQ ID:25576, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46833] Another function of VGAM1322 is therefore inhibition of GRWD (Accession NM_031485). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRWD. H2AV (Accession NM_138635) is another VGAM1322 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28908, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46834] Another function of VGAM1322 is therefore inhibition of H2AV (Accession NM_138635). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV. HCA4 (Accession XM_085287) is another VGAM1322 host target gene. HCA4 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38020, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46835] Another function of VGAM1322 is therefore inhibition of HCA4 (Accession XM_085287). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA0022 (Accession NM_014880) is another VGAM1322 host target gene. KIAA0022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0022 BINDING SITE, designated SEQ ID:17025, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46836] Another function of VGAM1322 is therefore inhibition of

KIAA0022 (Accession NM_014880). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0022. KIAA0186 (Accession NM_021067) is another VGAM1322 host target gene. KIAA0186 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0186, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0186 BINDING SITE, designated SEQ ID:22036, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46837] Another function of VGAM1322 is therefore inhibition of KIAA0186 (Accession NM_021067). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0186. KIAA0453 (Accession XM_044546) is another VGAM1322 host target gene. KIAA0453 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0453 BINDING SITE, designated SEQ ID:34228, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46838] Another function of VGAM1322 is therefore inhibition of KIAA0453 (Accession XM_044546). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0453. KIAA0475 (Accession NM_014864) is another VGAM1322 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16947, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46839] Another function of VGAM1322 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0514 (Accession NM_014696) is another

VGAM1322 host target gene. KIAA0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0514 BINDING SITE, designated SEQ ID:16204, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46840] Another function of VGAM1322 is therefore inhibition of KIAA0514 (Accession NM_014696). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0514. KIAA0557 (Accession XM_085507) is another VGAM1322 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38203, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46841] Another function of VGAM1322 is therefore inhibition of KIAA0557 (Accession XM_085507). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA0599 (Accession XM_085127) is another VGAM1322 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37854, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46842] Another function of VGAM1322 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0945 (Accession NM_014952) is another VGAM1322 host target gene. KIAA0945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0945, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0945 BINDING SITE, designated SEQ ID:17290, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46843] Another function of VGAM1322 is therefore inhibition of KIAA0945 (Accession NM_014952). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0945. KIAA1028 (Accession XM_166324) is another VGAM1322 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44154, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46844] Another function of VGAM1322 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1028. KIAA1040 (Accession XM_051091) is another VGAM1322 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35739, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46845] Another function of VGAM1322 is therefore inhibition of KIAA1040 (Accession XM_051091). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1198 (Accession XM_032674) is another VGAM1322 host target gene. KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1198, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE1 and KIAA1198 BINDING SITE2, designated SEQ ID:31703 and SEQ

ID:31704 respectively, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46846] Another function of VGAM1322 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1497 (Accession XM_041431) is another VGAM1322 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33524, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46847] Another function of VGAM1322 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. KIAA1582 (Accession XM_037262) is another VGAM1322 host target gene. KIAA1582 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32581, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46848] Another function of VGAM1322 is therefore inhibition of KIAA1582 (Accession XM_037262). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. KIAA1829 (Accession XM_030378) is another VGAM1322 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31028, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46849] Another function of VGAM1322 is therefore inhibition of

KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. KIAA1915 (Accession XM_055481) is another VGAM1322 host target gene. KIAA1915 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1915, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1915 BINDING SITE, designated SEQ ID:36268, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46850] Another function of VGAM1322 is therefore inhibition of KIAA1915 (Accession XM_055481). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1915. KIAA1918 (Accession XM_054951) is another VGAM1322 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36212, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46851] Another function of VGAM1322 is therefore inhibition of KIAA1918 (Accession XM_054951). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. KIAA1971 (Accession XM_058720) is another VGAM1322 host target gene. KIAA1971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:36728, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46852] Another function of VGAM1322 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. KIAA1987 (Accession XM_113870) is another

VGAM1322 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42494, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46853] Another function of VGAM1322 is therefore inhibition of KIAA1987 (Accession XM_113870). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277) is another VGAM1322 host target gene. KLK7 BINDING SITE1 and KLK7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KLK7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK7 BINDING SITE1 and KLK7 BINDING SITE2, designated SEQ ID:29273 and SEQ ID:11476 respectively, to the nucleotide se-

quence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46854] Another function of VGAM1322 is therefore inhibition of Kallikrein 7 (chymotryptic, stratum corneum) (KLK7, Accession NM_139277). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK7. MGC3771 (Accession NM_030970) is another VGAM1322 host target gene. MGC3771 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC3771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3771 BINDING SITE, designated SEQ ID:25233, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46855] Another function of VGAM1322 is therefore inhibition of MGC3771 (Accession NM_030970). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3771. MGC4638 (Accession NM_031479) is another VGAM1322 host target gene. MGC4638 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4638 BINDING SITE, designated SEQ ID:25557, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46856] Another function of VGAM1322 is therefore inhibition of MGC4638 (Accession NM_031479). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4638. Makorin, Ring Finger Protein, 4 (MKRN4, Accession NM_030757) is another VGAM1322 host target gene. MKRN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKRN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN4 BINDING SITE, designated SEQ ID:25041, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46857] Another function of VGAM1322 is therefore inhibition of Makorin, Ring Finger Protein, 4 (MKRN4, Accession NM_030757). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN4. Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915) is another VGAM1322 host target gene. MRPL44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL44 BINDING SITE, designated SEQ ID:23226, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46858] Another function of VGAM1322 is therefore inhibition of Mitochondrial Ribosomal Protein L44 (MRPL44, Accession NM_022915). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL44. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084) is another VGAM1322 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17473, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46859] Another function of VGAM1322 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM_015084). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27.

p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM1322 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21390, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46860] Another function of VGAM1322 is therefore inhibition of

p21(CDKN1A)–activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. PRO0365 (Accession NM_014126) is another VGAM1322 host target gene. PRO0365 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0365, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0365 BINDING SITE, designated SEQ ID:15385, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46861] Another function of VGAM1322 is therefore inhibition of PRO0365 (Accession NM_014126). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0365. Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM_030777) is another VGAM1322 host target gene. SLC2A10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

SLC2A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:25062, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46862] Another function of VGAM1322 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM_030777). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A10. SSH2 (Accession XM_030846) is another VGAM1322 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31177, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46863] Another function of VGAM1322 is therefore inhibition of

SSH2 (Accession XM_030846). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. TU12B1-TY (Accession NM_016575) is another VGAM1322 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18643, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46864] Another function of VGAM1322 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. LOC115704 (Accession XM_056533) is another VGAM1322 host target gene. LOC115704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC115704 BINDING SITE, designated SEQ ID:36401, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46865] Another function of VGAM1322 is therefore inhibition of LOC115704 (Accession XM_056533). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115704. LOC116236 (Accession XM_057674) is another VGAM1322 host target gene. LOC116236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116236 BINDING SITE, designated SEQ ID:36544, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46866] Another function of VGAM1322 is therefore inhibition of LOC116236 (Accession XM_057674). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116236. LOC120526 (Accession XM_058475) is an-

other VGAM1322 host target gene. LOC120526 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120526, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120526 BINDING SITE, designated SEQ ID:36623, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46867] Another function of VGAM1322 is therefore inhibition of LOC120526 (Accession XM_058475). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120526. LOC121506 (Accession XM_058570) is another VGAM1322 host target gene. LOC121506 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC121506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121506 BINDING SITE, designated SEQ ID:36667, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46868] Another function of VGAM1322 is therefore inhibition of LOC121506 (Accession XM_058570). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121506. LOC128387 (Accession XM_059243) is another VGAM1322 host target gene. LOC128387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128387 BINDING SITE, designated SEQ ID:36928, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46869] Another function of VGAM1322 is therefore inhibition of LOC128387 (Accession XM_059243). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128387. LOC132625 (Accession XM_067946) is another VGAM1322 host target gene. LOC132625 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132625, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132625 BINDING SITE, designated SEQ ID:37372, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46870] Another function of VGAM1322 is therefore inhibition of LOC132625 (Accession XM_067946). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132625. LOC135763 (Accession NM_138572) is another VGAM1322 host target gene. LOC135763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28880, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46871] Another function of VGAM1322 is therefore inhibition of LOC135763 (Accession NM_138572). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC135763. LOC143187 (Accession NM_145206) is another VGAM1322 host target gene. LOC143187 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143187 BINDING SITE, designated SEQ ID:29743, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46872] Another function of VGAM1322 is therefore inhibition of LOC143187 (Accession NM_145206). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143187. LOC145226 (Accession XM_085058) is another VGAM1322 host target gene. LOC145226 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145226, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145226 BINDING SITE, designated SEQ ID:37810, to the nucleotide sequence of VGAM1322 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4033.

[46873] Another function of VGAM1322 is therefore inhibition of LOC145226 (Accession XM_085058). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145226. LOC145955 (Accession XM_096912) is another VGAM1322 host target gene. LOC145955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145955 BINDING SITE, designated SEQ ID:40643, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46874] Another function of VGAM1322 is therefore inhibition of LOC145955 (Accession XM_096912). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145955. LOC146455 (Accession XM_085471) is another VGAM1322 host target gene. LOC146455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146455, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146455 BINDING SITE, designated SEQ ID:38156, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46875] Another function of VGAM1322 is therefore inhibition of LOC146455 (Accession XM_085471). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146455. LOC146909 (Accession XM_085634) is another VGAM1322 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38264, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46876] Another function of VGAM1322 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC146909. LOC147429 (Accession XM_085793) is another VGAM1322 host target gene. LOC147429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147429 BINDING SITE, designated SEQ ID:38336, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46877] Another function of VGAM1322 is therefore inhibition of LOC147429 (Accession XM_085793). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147429. LOC149117 (Accession XM_097587) is another VGAM1322 host target gene. LOC149117 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149117 BINDING SITE, designated SEQ ID:40953, to

the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46878] Another function of VGAM1322 is therefore inhibition of LOC149117 (Accession XM_097587). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149117. LOC149461 (Accession XM_086547) is another VGAM1322 host target gene. LOC149461 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149461 BINDING SITE, designated SEQ ID:38760, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46879] Another function of VGAM1322 is therefore inhibition of LOC149461 (Accession XM_086547). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149461. LOC149836 (Accession XM_086685) is another VGAM1322 host target gene. LOC149836 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC149836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149836 BINDING SITE, designated SEQ ID:38824, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46880] Another function of VGAM1322 is therefore inhibition of LOC149836 (Accession XM_086685). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149836. LOC150054 (Accession XM_097797) is another VGAM1322 host target gene. LOC150054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150054 BINDING SITE, designated SEQ ID:41124, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46881] Another function of VGAM1322 is therefore inhibition of LOC150054 (Accession XM_097797). Accordingly, utilities

of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150054. LOC150960 (Accession XM_087059) is another VGAM1322 host target gene. LOC150960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150960 BINDING SITE, designated SEQ ID:39029, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46882] Another function of VGAM1322 is therefore inhibition of LOC150960 (Accession XM_087059). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150960. LOC152925 (Accession XM_087559) is another VGAM1322 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152925 BINDING SITE, designated SEQ ID:39329, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46883] Another function of VGAM1322 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC154739 (Accession XM_098602) is another VGAM1322 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41715, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46884] Another function of VGAM1322 is therefore inhibition of LOC154739 (Accession XM_098602). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC157798 (Accession XM_098827) is another VGAM1322 host target gene. LOC157798 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157798 BINDING SITE, designated SEQ ID:41846, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46885] Another function of VGAM1322 is therefore inhibition of LOC157798 (Accession XM_098827). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC158237 (Accession XM_017584) is another VGAM1322 host target gene. LOC158237 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158237 BINDING SITE, designated SEQ ID:30326, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46886] Another function of VGAM1322 is therefore inhibition of

LOC158237 (Accession XM_017584). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158237. LOC165229 (Accession XM_092464) is another VGAM1322 host target gene. LOC165229 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165229 BINDING SITE, designated SEQ ID:40124, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46887] Another function of VGAM1322 is therefore inhibition of LOC165229 (Accession XM_092464). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165229. LOC170082 (Accession XM_093092) is another VGAM1322 host target gene. LOC170082 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC170082 BINDING SITE, designated SEQ ID:40168, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46888] Another function of VGAM1322 is therefore inhibition of LOC170082 (Accession XM_093092). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170082. LOC196264 (Accession XM_113683) is another VGAM1322 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42333, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46889] Another function of VGAM1322 is therefore inhibition of LOC196264 (Accession XM_113683). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC200169 (Accession XM_117200) is an-

other VGAM1322 host target gene. LOC200169 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:43283, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46890] Another function of VGAM1322 is therefore inhibition of LOC200169 (Accession XM_117200). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200169. LOC200314 (Accession XM_117225) is another VGAM1322 host target gene. LOC200314 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200314 BINDING SITE, designated SEQ ID:43292, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46891] Another function of VGAM1322 is therefore inhibition of LOC200314 (Accession XM_117225). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200314. LOC200339 (Accession XM_117226) is another VGAM1322 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43296, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46892] Another function of VGAM1322 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC200860 (Accession XM_117289) is another VGAM1322 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43352, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46893] Another function of VGAM1322 is therefore inhibition of LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200860. LOC201292 (Accession XM_113949) is another VGAM1322 host target gene. LOC201292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201292 BINDING SITE, designated SEQ ID:42562, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46894] Another function of VGAM1322 is therefore inhibition of LOC201292 (Accession XM_113949). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201292. LOC201294 (Accession XM_113950) is another VGAM1322 host target gene. LOC201294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201294 BINDING SITE, designated SEQ ID:42565, to the nucleotide sequence of VGAM1322 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4033.

[46895] Another function of VGAM1322 is therefore inhibition of LOC201294 (Accession XM_113950). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201294. LOC203276 (Accession XM_117523) is another VGAM1322 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43482, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46896] Another function of VGAM1322 is therefore inhibition of LOC203276 (Accession XM_117523). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM_117529) is another VGAM1322 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43506, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46897] Another function of VGAM1322 is therefore inhibition of LOC203305 (Accession XM_117529). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC220662 (Accession XM_165978) is another VGAM1322 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43821, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46898] Another function of VGAM1322 is therefore inhibition of LOC220662 (Accession XM_165978). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220662. LOC222070 (Accession XM_168433) is another VGAM1322 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45177, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46899] Another function of VGAM1322 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC254243 (Accession XM_173233) is another VGAM1322 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46508, to

the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46900] Another function of VGAM1322 is therefore inhibition of LOC254243 (Accession XM_173233). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC51193 (Accession NM_016331) is another VGAM1322 host target gene. LOC51193 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51193 BINDING SITE, designated SEQ ID:18453, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46901] Another function of VGAM1322 is therefore inhibition of LOC51193 (Accession NM_016331). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51193. LOC51200 (Accession NM_016352) is another VGAM1322 host target gene. LOC51200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC51200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51200 BINDING SITE, designated SEQ ID:18480, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46902] Another function of VGAM1322 is therefore inhibition of LOC51200 (Accession NM_016352). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51200. LOC89932 (Accession XM_027341) is another VGAM1322 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30487, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46903] Another function of VGAM1322 is therefore inhibition of LOC89932 (Accession XM_027341). Accordingly, utilities

of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. LOC90038 (Accession XM_028305) is another VGAM1322 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30645, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46904] Another function of VGAM1322 is therefore inhibition of LOC90038 (Accession XM_028305). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. LOC90371 (Accession XM_031261) is another VGAM1322 host target gene. LOC90371 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90371 BINDING SITE, designated SEQ ID:31319, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46905] Another function of VGAM1322 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. LOC90408 (Accession XM_031517) is another VGAM1322 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31394, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46906] Another function of VGAM1322 is therefore inhibition of LOC90408 (Accession XM_031517). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. LOC92249 (Accession XM_043814) is another VGAM1322 host target gene. LOC92249 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34023, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46907] Another function of VGAM1322 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. LOC92283 (Accession XM_044049) is another VGAM1322 host target gene. LOC92283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92283 BINDING SITE, designated SEQ ID:34091, to the nucleotide sequence of VGAM1322 RNA, herein designated VGAM RNA, also designated SEQ ID:4033.

[46908] Another function of VGAM1322 is therefore inhibition of

LOC92283 (Accession XM_044049). Accordingly, utilities of VGAM1322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92283. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1323 (VGAM1323) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46909] VGAM1323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1323 was detected is described hereinabove with reference to Figs. 1-8.

[46910] VGAM1323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus. VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46911] VGAM1323 gene encodes a VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1323 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1323 precursor RNA is designated SEQ ID:1309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1309 is located at position 5155 relative to the genome of Garlic Latent Virus.

- [46912] VGAM1323 precursor RNA folds onto itself, forming VGAM1323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [46913] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1323 folded precursor RNA into VGAM1323 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide se-

quence of VGAM1323 RNA is designated SEQ ID:4034, and is provided hereinbelow with reference to the sequence listing part.

[46914] VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1323 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[46915] VGAM1323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1323 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[46916] The complementary binding of VGAM1323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1323 host target RNA into VGAM1323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46917] It is appreciated that VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1323 host target genes. The mRNA of each one of this plurality of VGAM1323 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1323 RNA, herein designated VGAM RNA, and which when bound by VGAM1323 RNA causes inhibition of translation of respective one or more VGAM1323 host target proteins.

[46918] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1323 gene, herein designated VGAM GENE, on one or more VGAM1323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46919] It is yet further appreciated that a function of VGAM1323

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1323 correlate with, and may be deduced from, the identity of the host target genes which VGAM1323 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46920] Nucleotide sequences of the VGAM1323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1323 are further described hereinbelow with reference to Table 1.

[46921] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1323 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46922] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1323 gene, herein designated VGAM is inhibition of expression of VGAM1323 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1323 correlate with, and may be deduced from, the identity of the target genes which VGAM1323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46923] Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM_130442) is a VGAM1323 host target gene. ELMO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO1 BINDING SITE, designated SEQ ID:28201, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46924] A function of VGAM1323 is therefore inhibition of Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM_130442). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ELMO1. Formin 2 (FMN2, Accession XM_086525) is another VGAM1323 host target gene. FMN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FMN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMN2 BINDING SITE, designated SEQ ID:38742, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46925] Another function of VGAM1323 is therefore inhibition of Formin 2 (FMN2, Accession XM_086525). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMN2. Glycogen Synthase 1 (muscle) (GYS1, Accession XM_114024) is another VGAM1323 host target gene. GYS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GYS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GYS1 BINDING SITE, designated SEQ ID:42625,

to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46926] Another function of VGAM1323 is therefore inhibition of Glycogen Synthase 1 (muscle) (GYS1, Accession XM_114024), a gene which transfers the glycosyl residue from udp-glc to the nonreducing end of alpha-1,4-glucan. Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GYS1. The function of GYS1 has been established by previous studies. To examine whether defective muscle GYS1 expression is associated with impaired glycogen synthesis in type 2 diabetes and whether the defect is inherited or acquired, Huang et al. (2000) measured GYS1 gene expression and enzyme activity in muscle biopsies taken before and after an insulin clamp in 12 monozygotic twin pairs discordant for type 2 diabetes and in 12 matched control subjects. The effect of insulin on GYS1 fractional activity, when expressed as the increment over the basal values, was significantly impaired in diabetic ($15.7 \pm 3.3\%$; P less than 0.01), but not in nondiabetic ($23.7 \pm 1.8\%$; $P = \text{NS}$) twins compared with that in control subjects ($28.1 \pm 2.3\%$). Insulin increased GYS1 mRNA expression in control subjects

(from 0.14 \pm 0.02 to 1.74 \pm 0.10 relative units; P less than 0.01) and in nondiabetic (from 0.24 \pm 0.05 to 1.81 \pm 0.16 relative units; P less than 0.01) and diabetic (from 0.20 \pm 0.07 to 1.08 \pm 0.14 relative units; P less than 0.01) twins. The effect of insulin on GYS1 expression was, however, significantly reduced in the diabetic (P less than 0.003), but not in the nondiabetic, twins, compared with that in control subjects. The postclamp GYS1 mRNA levels correlated strongly with the hemoglobin A1c levels ($r = -0.61$; P less than 0.001). The authors concluded that insulin stimulates GYS1 mRNA expression and that impaired stimulation of GYS1 gene expression by insulin in patients with type 2 diabetes is acquired and most likely is secondary to chronic hyperglycemia. Inbred mouse strains fed on a diabetogenic diet (high in fat and sucrose) differ in their propensities to develop features analogous to type 2 diabetes mellitus. To define chromosomal locations that control these characteristics, Seldin et al. (1994) studied recombinant inbred strains from diabetes-prone C57BL/6J and diabetes-resistant A/J strains. Hyperglycemia correlated with the marker D7Mit25 on mouse chromosome 7. This putative susceptibility locus is consistent with that of the glycogen synthase gene, which was implicated by

Groop et al. (1993) in the pathogenesis of type 2 diabetes in the human. Seldin et al. (1994) found that fractional glycogen synthase activity in isolated muscle was significantly lower in normal B/6J diabetes-prone mice than in normal diabetes-resistant A/J mice, a finding similar to that reported in relatives of human patients with type 2 diabetes.

[46927] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46928] Huang, X.; Vaag, A.; Hansson, M.; Weng, J.; Laurila, E.; Groop, L. : Impaired insulin-stimulated expression of the glycogen synthase gene in skeletal muscle of type 2 diabetic patients is acquired rather than inherited. J. Clin. Endocr. Metab. 85: 1584–1590, 2000. ; and

[46929] Seldin, M. F.; Mott, D.; Bhat, D.; Petro, A.; Kuhn, C. M.; Kingsmore, S. F.; Bogardus, C.; Opara, E.; Feinglos, M. N.; Surwit, R. S. : Glycogen synthase: a putative locus for diet-induc.

[46930] Further studies establishing the function and utilities of GYS1 are found in John Hopkins OMIM database record ID 138570, and in cited publications numbered 11617–11623 listed in the bibliography section hereinbe–

low, which are also hereby incorporated by reference. Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068) is another VGAM1323 host target gene. SIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIM1 BINDING SITE, designated SEQ ID:11508, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46931] Another function of VGAM1323 is therefore inhibition of Single-minded Homolog 1 (Drosophila) (SIM1, Accession NM_005068), a gene which may have pleiotropic effects during embryogenesis and in the adult. Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM1. The function of SIM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.FLJ11383 (Accession NM_024938) is another VGAM1323 host target gene. FLJ11383 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by FLJ11383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11383 BINDING SITE, designated SEQ ID:24479, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46932] Another function of VGAM1323 is therefore inhibition of FLJ11383 (Accession NM_024938). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11383. KIAA0268 (Accession XM_046126) is another VGAM1323 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:34686, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46933] Another function of VGAM1323 is therefore inhibition of KIAA0268 (Accession XM_046126). Accordingly, utilities

of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0268. KIAA0416 (Accession NM_015564) is another VGAM1323 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17838, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46934] Another function of VGAM1323 is therefore inhibition of KIAA0416 (Accession NM_015564). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. KIAA0836 (Accession XM_035390) is another VGAM1323 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0836 BINDING SITE, designated SEQ ID:32244, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46935] Another function of VGAM1323 is therefore inhibition of KIAA0836 (Accession XM_035390). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA0884 (Accession XM_046660) is another VGAM1323 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34774, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46936] Another function of VGAM1323 is therefore inhibition of KIAA0884 (Accession XM_046660). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. SMOC1 (Accession NM_022137) is another VGAM1323 host target gene. SMOC1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMOC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC1 BINDING SITE, designated SEQ ID:22699, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46937] Another function of VGAM1323 is therefore inhibition of SMOC1 (Accession NM_022137). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC1. LOC115399 (Accession XM_055874) is another VGAM1323 host target gene. LOC115399 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115399 BINDING SITE, designated SEQ ID:36343, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46938] Another function of VGAM1323 is therefore inhibition of

LOC115399 (Accession XM_055874). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115399. LOC116236 (Accession XM_057674) is another VGAM1323 host target gene. LOC116236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116236 BINDING SITE, designated SEQ ID:36543, to the nucleotide sequence of VGAM1323 RNA, herein designated VGAM RNA, also designated SEQ ID:4034.

[46939] Another function of VGAM1323 is therefore inhibition of LOC116236 (Accession XM_057674). Accordingly, utilities of VGAM1323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116236. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1324 (VGAM1324) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[46940] VGAM1324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1324 was detected is described hereinabove with reference to Figs. 1–8.

[46941] VGAM1324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus. VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46942] VGAM1324 gene encodes a VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1324 precursor RNA is designated SEQ ID:1310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1310 is located at position 4855 relative to the genome of Garlic Latent Virus.

[46943] VGAM1324 precursor RNA folds onto itself, forming VGAM1324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[46944] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1324 folded precursor RNA into VGAM1324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1324 RNA is designated SEQ ID:4035, and is provided hereinbelow with reference to the sequence listing part.

[46945] VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1324 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[46946] VGAM1324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1324 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[46947] The complementary binding of VGAM1324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1324 host target RNA into VGAM1324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[46948] It is appreciated that VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1324 host target genes. The mRNA of each one of this plurality of VGAM1324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1324 RNA, herein designated VGAM RNA, and which when bound by VGAM1324 RNA causes inhibition of translation of respective one or more VGAM1324 host target proteins.

[46949] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1324 gene, herein designated VGAM GENE, on one

or more VGAM1324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[46950] It is yet further appreciated that a function of VGAM1324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1324 correlate with, and may be deduced from, the identity of the host target genes which VGAM1324 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[46951] Nucleotide sequences of the VGAM1324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1324 are further described hereinbelow with reference to Table 1.

[46952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1324 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[46953] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1324 gene, herein designated VGAM is inhibition of expression of VGAM1324 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1324 correlate with, and may be deduced from, the identity of the target genes which VGAM1324 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[46954] Chemokine (C-C motif) Receptor 9 (CCR9, Accession

NM_006641) is a VGAM1324 host target gene. CCR9 BINDING SITE1 and CCR9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR9 BINDING SITE1 and CCR9 BINDING SITE2, designated SEQ ID:13433 and SEQ ID:25250 respectively, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46955] A function of VGAM1324 is therefore inhibition of Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM_006641), a gene which binds beta-chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9. The function of CCR9 has been established by previous studies. Chemokines are small peptides involved in the chemotaxis and activation of leukocytes in response to inflammation, tissue damage, or infection. Chemokine receptors belong to the superfamily of G protein-coupled

receptors. See CMKBR1 (OMIM Ref. No. 601159) for background. Nibbs et al. (1997) stated that they had previously identified the mouse cysteine–cysteine (C–C) chemokine receptor D6. To identify the human homolog of D6, they performed PCR on human genomic DNA using primers based on the sequence of the mouse D6 gene. The human D6 gene encodes a predicted 384–amino acid protein that contains the characteristic 7 transmembrane domains and 4 conserved cysteine residues of chemokine receptors. The human and mouse D6 proteins share 71% amino acid identity. By Northern blot analysis, human D6 is expressed as approximately 4– and 6–kb transcripts in several tissues, with the highest expression in placenta. Although human D6 binds with relatively high–affinity to the majority of members of the beta–chemokine family (for example, MCP2; 602283), Nibbs et al. (1997) were unable to demonstrate any signaling following the ligand binding. Therefore, the International Union of Pharmacology (OMIM Ref. No. IUPHAR) proposed that the human D6 receptor be designated ccr9, with the lower cases indicating that receptor function has not been demonstrated. Bonini et al. (1997) cloned a cDNA encoding CMKBR9, which they called CCR10 because it is homologous to rat

'Ccr10-related receptor' (Ccr10rR). The CMKBR9 and rat Ccr10rR proteins have 72% amino acid identity. By PCR of a radiation hybrid panel, Bonini et al. (1997) mapped the CMKBR9 (CCBP2) gene to 3p21.32-p21.31, a region containing other C-C chemokine receptor genes such as CMKBR1, CMKBR2 (OMIM Ref. No. 601267), CMKBR3 (OMIM Ref. No. 601268), and CMKBR5 (OMIM Ref. No. 601373). By radiation hybrid analysis and organization of BAC contigs by FISH on combed genomic DNA, Maho et al. (1999) localized the CCBP2 gene within the CCR cluster at 3p21.3.

[46956] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[46957] Nibbs, R. J. B.; Wylie, S. M.; Yang, J.; Landau, N. R.; Graham, G. J. : Cloning and characterization of a novel promiscuous human beta-chemokine receptor D6. *J. Biol. Chem.* 272: 32078-32083, 1997. ; and

[46958] Bonini, J. A.; Martin, S. K.; Dralyuk, F.; Roe, M. W.; Philipson, L. H.; Steiner, D. F. : Cloning, expression, and chromosomal mapping of a novel human CC-chemokine receptor (CCR10) that.

[46959] Further studies establishing the function and utilities of

CCR9 are found in John Hopkins OMIM database record ID 602648, and in cited publications numbered 858 and 8586 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Collagen, Type XVII, Alpha 1 (COL17A1, Accession NM_000494) is another VGAM1324 host target gene. COL17A1 BINDING SITE1 and COL17A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL17A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL17A1 BINDING SITE1 and COL17A1 BINDING SITE2, designated SEQ ID:6107 and SEQ ID:10613 respectively, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46960] Another function of VGAM1324 is therefore inhibition of Collagen, Type XVII, Alpha 1 (COL17A1, Accession NM_000494). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL17A1. Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717) is another VGAM1324 host target gene. DGKI BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKI BINDING SITE, designated SEQ ID:11080, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46961] Another function of VGAM1324 is therefore inhibition of Diacylglycerol Kinase, Iota (DGKI, Accession NM_004717), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKI. The function of DGKI and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1107. Hermansky-Pudlak Syndrome 1 (HPS1, Accession NM_000195) is another VGAM1324 host target gene. HPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HPS1 BINDING SITE, designated SEQ ID:5695, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46962] Another function of VGAM1324 is therefore inhibition of Hermansky–Pudlak Syndrome 1 (HPS1, Accession NM_000195). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS1. Heparan Sulfate 2–O–sulfotransferase 1 (HS2ST1, Accession NM_012262) is another VGAM1324 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14579, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46963] Another function of VGAM1324 is therefore inhibition of Heparan Sulfate 2–O–sulfotransferase 1 (HS2ST1, Accession NM_012262). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HS2ST1. Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093) is another VGAM1324 host target gene. MAP3K7IP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K7IP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K7IP2 BINDING SITE, designated SEQ ID:17485, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46964] Another function of VGAM1324 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 7 Interacting Protein 2 (MAP3K7IP2, Accession NM_015093). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K7IP2. Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410) is another VGAM1324 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8241, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46965] Another function of VGAM1324 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. 8-oxoguanine DNA Glycosylase (OGG1, Accession NM_002542) is another VGAM1324 host target gene. OGG1 BINDING SITE1 through OGG1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE1 through OGG1 BINDING SITE3, designated SEQ ID:8391, SEQ ID:18808 and SEQ ID:18813 respectively, to the nucleotide sequence of

VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46966] Another function of VGAM1324 is therefore inhibition of 8-oxoguanine DNA Glycosylase (OGG1, Accession NM_002542), a gene which is involved in base excision DNA repair and removal of 8-oxyguanine. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGG1. The function of OGG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM390. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480) is another VGAM1324 host target gene. PPP1R12A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R12A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12A BINDING SITE, designated SEQ ID:8306, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46967] Another function of VGAM1324 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12A (PPP1R12A, Accession NM_002480), a gene which regulates the interaction of actin and myosin. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12A. The function of PPP1R12A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM838. Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM_006259) is another VGAM1324 host target gene. PRKG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG2 BINDING SITE, designated SEQ ID:12941, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46968] Another function of VGAM1324 is therefore inhibition of Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM_006259), a gene which regulate a great variety of

functions, including smooth muscle relaxation, neuronal excitability, and epithelial electrolyte transport. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG2. The function of PRKG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM16. TEM6 (Accession NM_022748) is another VGAM1324 host target gene. TEM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM6 BINDING SITE, designated SEQ ID:22965, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46969] Another function of VGAM1324 is therefore inhibition of TEM6 (Accession NM_022748), a gene which displays elevated expression during tumor angiogenesis. Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM6. The function of TEM6 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175.BCoR (Accession NM_017745) is another VGAM1324 host target gene. BCoR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCoR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCoR BINDING SITE, designated SEQ ID:19339, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46970] Another function of VGAM1324 is therefore inhibition of BCoR (Accession NM_017745). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCoR. Calmegin (CLGN, Accession NM_004362) is another VGAM1324 host target gene. CLGN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLGN BINDING SITE,

designated SEQ ID:10568, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46971] Another function of VGAM1324 is therefore inhibition of Calmegin (CLGN, Accession NM_004362). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLGN. DKFZP564F013 (Accession XM_168479) is another VGAM1324 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45206, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46972] Another function of VGAM1324 is therefore inhibition of DKFZP564F013 (Accession XM_168479). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. DKFZp761F2014 (Accession

NM_020215) is another VGAM1324 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21465, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46973] Another function of VGAM1324 is therefore inhibition of DKFZp761F2014 (Accession NM_020215). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. FLJ10738 (Accession NM_018199) is another VGAM1324 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:20069, to the nucleotide sequence of VGAM1324 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4035.

[46974] Another function of VGAM1324 is therefore inhibition of FLJ10738 (Accession NM_018199). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. FLJ13962 (Accession NM_024862) is another VGAM1324 host target gene. FLJ13962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13962 BINDING SITE, designated SEQ ID:24297, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46975] Another function of VGAM1324 is therefore inhibition of FLJ13962 (Accession NM_024862). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13962. FLJ14621 (Accession NM_032811) is another VGAM1324 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14621, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26584, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46976] Another function of VGAM1324 is therefore inhibition of FLJ14621 (Accession NM_032811). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. FLJ20275 (Accession NM_017737) is another VGAM1324 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:19324, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46977] Another function of VGAM1324 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20275. KIAA1013 (Accession XM_114303) is another VGAM1324 host target gene. KIAA1013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1013 BINDING SITE, designated SEQ ID:42858, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46978] Another function of VGAM1324 is therefore inhibition of KIAA1013 (Accession XM_114303). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1013. KIAA1028 (Accession XM_166324) is another VGAM1324 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44165, to the

nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46979] Another function of VGAM1324 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1254 (Accession XM_046132) is another VGAM1324 host target gene. KIAA1254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:34700, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46980] Another function of VGAM1324 is therefore inhibition of KIAA1254 (Accession XM_046132). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254. MGC16175 (Accession NM_032765) is another VGAM1324 host target gene. MGC16175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC16175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16175 BINDING SITE, designated SEQ ID:26512, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46981] Another function of VGAM1324 is therefore inhibition of MGC16175 (Accession NM_032765). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16175. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM1324 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:32722, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46982] Another function of VGAM1324 is therefore inhibition of

Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. Ring Finger Protein 38 (RNF38, Accession NM_022781) is another VGAM1324 host target gene. RNF38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF38 BINDING SITE, designated SEQ ID:23061, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46983] Another function of VGAM1324 is therefore inhibition of Ring Finger Protein 38 (RNF38, Accession NM_022781). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF38. SP329 (Accession NM_030793) is another VGAM1324 host target gene. SP329 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SP329, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP329 BINDING SITE, designated SEQ ID:25098, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46984] Another function of VGAM1324 is therefore inhibition of SP329 (Accession NM_030793). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP329. LOC145195 (Accession XM_096731) is another VGAM1324 host target gene. LOC145195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145195 BINDING SITE, designated SEQ ID:40517, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46985] Another function of VGAM1324 is therefore inhibition of LOC145195 (Accession XM_096731). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145195. LOC145900 (Accession XM_085276) is another VGAM1324 host target gene. LOC145900 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145900 BINDING SITE, designated SEQ ID:38011, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46986] Another function of VGAM1324 is therefore inhibition of LOC145900 (Accession XM_085276). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145900. LOC149372 (Accession XM_086509) is another VGAM1324 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38733, to

the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46987] Another function of VGAM1324 is therefore inhibition of LOC149372 (Accession XM_086509). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC153146 (Accession XM_098319) is another VGAM1324 host target gene. LOC153146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153146 BINDING SITE, designated SEQ ID:41576, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46988] Another function of VGAM1324 is therefore inhibition of LOC153146 (Accession XM_098319). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153146. LOC203378 (Accession XM_117541) is another VGAM1324 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC203378, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43547, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46989] Another function of VGAM1324 is therefore inhibition of LOC203378 (Accession XM_117541). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. LOC254778 (Accession XM_171193) is another VGAM1324 host target gene. LOC254778 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254778, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254778 BINDING SITE, designated SEQ ID:45976, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46990] Another function of VGAM1324 is therefore inhibition of LOC254778 (Accession XM_171193). Accordingly, utilities

of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254778. LOC254936 (Accession XM_170770) is another VGAM1324 host target gene. LOC254936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:45526, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46991] Another function of VGAM1324 is therefore inhibition of LOC254936 (Accession XM_170770). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254936. LOC51580 (Accession NM_015874) is another VGAM1324 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC51580 BINDING SITE, designated SEQ ID:18012, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46992] Another function of VGAM1324 is therefore inhibition of LOC51580 (Accession NM_015874). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC90639 (Accession XM_033092) is another VGAM1324 host target gene. LOC90639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90639 BINDING SITE, designated SEQ ID:31833, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46993] Another function of VGAM1324 is therefore inhibition of LOC90639 (Accession XM_033092). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90639. LOC90777 (Accession XM_034052) is another VGAM1324 host target gene. LOC90777 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90777, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90777 BINDING SITE, designated SEQ ID:31990, to the nucleotide sequence of VGAM1324 RNA, herein designated VGAM RNA, also designated SEQ ID:4035.

[46994] Another function of VGAM1324 is therefore inhibition of LOC90777 (Accession XM_034052). Accordingly, utilities of VGAM1324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90777. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1325 (VGAM1325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[46995] VGAM1325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1325 was detected is described hereinabove with reference to Figs. 1-8.

[46996] VGAM1325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus.

VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[46997] VGAM1325 gene encodes a VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1325 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1325 precursor RNA is designated SEQ ID:1311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1311 is located at position 3735 relative to the genome of Garlic Latent Virus.

[46998] VGAM1325 precursor RNA folds onto itself, forming VGAM1325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[46999] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1325 folded precursor RNA into VGAM1325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1325 RNA is designated SEQ ID:4036, and is provided hereinbelow with reference to the sequence listing part.

[47000] VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1325 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47001] VGAM1325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1325 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1325 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47002] The complementary binding of VGAM1325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1325 host target RNA into VGAM1325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47003] It is appreciated that VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1325 host target genes. The mRNA of each one of this plurality of VGAM1325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1325 RNA, herein designated VGAM RNA, and which when bound by VGAM1325 RNA causes inhibition of translation of respective one or more VGAM1325 host target proteins.

[47004] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1325 gene, herein designated VGAM GENE, on one or more VGAM1325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47005] It is yet further appreciated that a function of VGAM1325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1325 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1325 correlate with, and may be deduced from, the identity of the host target genes which VGAM1325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47006] Nucleotide sequences of the VGAM1325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1325 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1325 are further described hereinbelow with reference to Table 1.

[47007] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1325 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47008] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1325 gene, herein designated VGAM is inhibition of expression of VGAM1325 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1325 correlate with, and may be deduced from, the identity of the target genes which VGAM1325 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47009] Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512) is a VGAM1325 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12032, to the nucleotide sequence of VGAM1325 RNA, herein designated VGAM RNA, also designated SEQ ID:4036.

[47010] A function of VGAM1325 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM1325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055) is another VGAM1325 host target gene. GFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFAP BINDING SITE, designated SEQ ID:7814, to the nucleotide sequence of VGAM1325 RNA, herein designated VGAM RNA, also designated SEQ ID:4036.

[47011] Another function of VGAM1325 is therefore inhibition of Glial Fibrillary Acidic Protein (GFAP, Accession NM_002055). Accordingly, utilities of VGAM1325 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with GFAP. LOC91252 (Accession XM_037173) is another VGAM1325 host target gene. LOC91252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91252 BINDING SITE, designated SEQ ID:32551, to the nucleotide sequence of VGAM1325 RNA, herein designated VGAM RNA, also designated SEQ ID:4036.

[47012] Another function of VGAM1325 is therefore inhibition of LOC91252 (Accession XM_037173). Accordingly, utilities of VGAM1325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91252. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1326 (VGAM1326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47013] VGAM1326 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1326 was detected is described hereinabove with reference to Figs. 1–8.

[47014] VGAM1326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus.

VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47015] VGAM1326 gene encodes a VGAM1326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1326 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1326 precursor RNA is designated SEQ ID:1312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1312 is located at position 91066 relative to the genome of Myxoma Virus.

[47016] VGAM1326 precursor RNA folds onto itself, forming VGAM1326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47017] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1326 folded precursor RNA into VGAM1326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1326 RNA is designated SEQ ID:4037, and is provided hereinbelow with reference to the sequence listing part.

[47018] VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1326 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47019] VGAM1326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1326 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47020] The complementary binding of VGAM1326 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1326 host target RNA into VGAM1326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47021] It is appreciated that VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1326 host target genes. The mRNA of each one of this plurality of VGAM1326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1326 RNA, herein designated VGAM RNA, and which when bound by VGAM1326 RNA causes inhibition of translation of respective one or more VGAM1326 host target proteins.

[47022] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1326 gene, herein designated VGAM GENE, on one or more VGAM1326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47023] It is yet further appreciated that a function of VGAM1326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1326 correlate with, and may be deduced from, the identity of the host target genes which VGAM1326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47024] Nucleotide sequences of the VGAM1326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1326 are further described hereinbelow with reference to Table 1.

[47025] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1326 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47026] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1326 gene, herein designated VGAM is inhibition of expression of VGAM1326 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1326 correlate with, and may be deduced from, the identity of the target genes which VGAM1326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47027] Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM_000692) is a VGAM1326 host target gene. ALDH1B1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by ALDH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1B1 BINDING SITE, designated SEQ ID:6347, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47028] A function of VGAM1326 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM_000692). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1B1. Complement Component 7 (C7, Accession NM_000587) is another VGAM1326 host target gene. C7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:6187, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47029] Another function of VGAM1326 is therefore inhibition of Complement Component 7 (C7, Accession NM_000587). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7. Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM_035453) is another VGAM1326 host target gene. CLASP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP2 BINDING SITE, designated SEQ ID:32266, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47030] Another function of VGAM1326 is therefore inhibition of Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM_035453), a gene which is involved in the regional regulation of microtubule dynamics in motile fibroblasts. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP2. The function of CLASP2 and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM897. Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391) is another VGAM1326 host target gene. CYP8B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP8B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP8B1 BINDING SITE, designated SEQ ID:10620, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47031] Another function of VGAM1326 is therefore inhibition of Cytochrome P450, Subfamily VIII B (sterol 12- α -hydroxylase), Polypeptide 1 (CYP8B1, Accession NM_004391), a gene which functions in bile acid biosynthesis. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP8B1. The function of CYP8B1 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM923.Decorin (DCN, Accession NM_133507) is another VGAM1326 host target gene. DCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCN BINDING SITE, designated SEQ ID:28574, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47032] Another function of VGAM1326 is therefore inhibition of Decorin (DCN, Accession NM_133507), a gene which may mediate in epithelial/mesenchymal interactions . Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCN. The function of DCN has been established by previous studies. Decorin and biglycan (OMIM Ref. No. 301870) are related but distinct small proteoglycans found in many connective tissues. Danielson et al. (1993) found that the human decorin gene spans more than 38 kb and contains 8 exons and very large introns, 2 of which are 5.4 and more than 13.2 kb. They discovered 2

alternatively spliced leader exons, Ia and Ib, in the 5-prime untranslated region. Using Northern blotting or reverse transcriptase PCR, they detected the 2 leader exons in a variety of mRNAs isolated from human cell lines and tissues. Sequences highly homologous (OMIM Ref. No. 74–87%) to exons Ia and Ib were found in the 5-prime untranslated region of avian and bovine decorin, respectively. This high degree of conservation among species suggested regulatory functions for these leader exons. In situ hybridization studies of developing mouse embryos suggested that decorin may play a role in epithelial/mesenchymal interactions during organ development and shaping (Scholzen et al., 1994). Dyne et al. (1996) studied 2 patients with osteogenesis imperfecta and the same gly415-to-ser mutation of the COL1A1 gene (120150.0044), but a different clinical expression. They speculated that these differences could be the result of abnormalities in other connective tissue proteins. Since decorin is a component of connective tissue, binds to type I collagen fibrils, and plays a role in matrix assembly, they studied decorin production in skin fibroblasts from these 2 patients. Cultured fibroblasts from the patient with extremely severe osteogenesis imperfecta (classified as type

II/III) were found to secrete barely detectable amounts of decorin into culture medium. Northern blot analysis showed decorin mRNA levels below the limit of detection. The patient with a less severe phenotype had fibroblasts that expressed decorin normally. Dyne et al. (1996) suggested that the different clinical phenotypes could be due to the differing genetic backgrounds of the patients, such that in the more severely affected patient the absence of decorin aggravated the clinical phenotype.

[47033] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47034] Scholzen, T.; Solursh, M.; Suzuki, S.; Reiter, R.; Morgan, J. L.; Buchberg, A. M.; Siracusa, L. D.; Iozzo, R. V. : The murine decorin: complete cDNA cloning, genomic organization, chromosomal assignment, and expression during organogenesis and tissue differentiation. *J. Biol. Chem.* 269: 28270–28281, 1994. ; and

[47036] Further studies establishing the function and utilities of

DCN are found in John Hopkins OMIM database record ID 125255, and in cited publications numbered 1989–1998 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEK Oncogene (DNA binding) (DEK, Accession NM_003472) is another VGAM1326 host target gene. DEK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEK BINDING SITE, designated SEQ ID:9536, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47037] Another function of VGAM1326 is therefore inhibition of DEK Oncogene (DNA binding) (DEK, Accession NM_003472), a gene which interacts in transcriptional regulation and signal transduction. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEK. The function of DEK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM795.EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838) is another VGAM1326 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41887, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47038] Another function of VGAM1326 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM_098838). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. MAP-kinase Activating Death Domain (MADD, Accession NM_130470) is another VGAM1326 host target gene. MADD BINDING SITE1 through MADD BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MADD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MADD BINDING SITE1 through MADD BINDING SITE6, designated SEQ ID:28234, SEQ ID:28250, SEQ ID:28245, SEQ ID:28240, SEQ ID:28255 and SEQ ID:9785 respectively, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47039] Another function of VGAM1326 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM_130470), a gene which may regulate two different pathways for neural activities.interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430.NKX3A (Accession NM_006167) is another VGAM1326 host target gene. NKX3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NKX3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NKX3A BINDING SITE, designated SEQ ID:12831, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47040] Another function of VGAM1326 is therefore inhibition of NKX3A (Accession NM_006167), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX3A. The function of NKX3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM481. Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563) is another VGAM1326 host target gene. SEDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEDL BINDING SITE, designated SEQ ID:15903, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47041] Another function of VGAM1326 is therefore inhibition of Spondyloepiphyseal Dysplasia, Late (SEDL, Accession NM_014563), a gene which may play role in vesicular transport from endoplasmic reticulum to golgi. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEDL. The function of SEDL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Splicing Factor, Arginine/serine-rich 2, Interacting Protein (SFRS2IP, Accession NM_004719) is another VGAM1326 host target gene. SFRS2IP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SFRS2IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2IP BINDING SITE, designated SEQ ID:11085, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47042] Another function of VGAM1326 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2, Interacting Protein

(SFRS2IP, Accession NM_004719), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2IP. The function of SFRS2IP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM700. Translin (TSN, Accession NM_004622) is another VGAM1326 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10988, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47043] Another function of VGAM1326 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function

of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98. Visinin-like 1 (VSNL1, Accession NM_003385) is another VGAM1326 host target gene. VSNL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VSNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSNL1 BINDING SITE, designated SEQ ID:9419, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47044] Another function of VGAM1326 is therefore inhibition of Visinin-like 1 (VSNL1, Accession NM_003385). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSNL1. Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM_000638) is another VGAM1326 host target gene. VTN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VTN, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VTN BINDING SITE, designated SEQ ID:6274, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47045] Another function of VGAM1326 is therefore inhibition of Vitronectin (serum spreading factor, somatomedin B, complement S-protein) (VTN, Accession NM_000638), a gene which is a cell adhesion and spreading factor found in serum and tissues. Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VTN. The function of VTN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM850.Ac-like Transposable Element (ALTE, Accession NM_004729) is another VGAM1326 host target gene. ALTE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALTE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALTE BINDING SITE, designated SEQ ID:11108, to the nu-

cleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47046] Another function of VGAM1326 is therefore inhibition of Ac-like Transposable Element (ALTE, Accession NM_004729). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALTE. Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession NM_080863) is another VGAM1326 host target gene. ASB16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB16 BINDING SITE, designated SEQ ID:28107, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47047] Another function of VGAM1326 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 16 (ASB16, Accession NM_080863). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB16. Chromosome 11 Open Reading Frame 17 (C11orf17, Accession

NM_020642) is another VGAM1326 host target gene. C11orf17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf17 BINDING SITE, designated SEQ ID:21805, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47048] Another function of VGAM1326 is therefore inhibition of Chromosome 11 Open Reading Frame 17 (C11orf17, Accession NM_020642). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf17. Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945) is another VGAM1326 host target gene. C21orf25 BINDING SITE1 and C21orf25 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by C21orf25, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf25 BIND-

ING SITE1 and C21orf25 BINDING SITE2, designated SEQ ID:31797 and SEQ ID:31803 respectively, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47049] Another function of VGAM1326 is therefore inhibition of Chromosome 21 Open Reading Frame 25 (C21orf25, Accession XM_032945). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf25. Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM_014918) is another VGAM1326 host target gene. CHSY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHSY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHSY1 BINDING SITE, designated SEQ ID:17171, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47050] Another function of VGAM1326 is therefore inhibition of Carbohydrate (chondroitin) Synthase 1 (CHSY1, Accession NM_014918). Accordingly, utilities of VGAM1326 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with CHSY1. DKFZP434B044 (Accession NM_031476) is another VGAM1326 host target gene. DKFZP434B044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:25552, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47051] Another function of VGAM1326 is therefore inhibition of DKFZP434B044 (Accession NM_031476). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B044. DKFZp761F2014 (Accession NM_020215) is another VGAM1326 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21462, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47052] Another function of VGAM1326 is therefore inhibition of DKFZp761F2014 (Accession NM_020215). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. DKFZp761N1114 (Accession XM_086327) is another VGAM1326 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38604, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47053] Another function of VGAM1326 is therefore inhibition of DKFZp761N1114 (Accession XM_086327). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp761N1114. FLJ10640 (Accession NM_019023) is another VGAM1326 host target gene. FLJ10640 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10640, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10640 BINDING SITE, designated SEQ ID:21111, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47054] Another function of VGAM1326 is therefore inhibition of FLJ10640 (Accession NM_019023). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10640. FLJ13114 (Accession NM_024541) is another VGAM1326 host target gene. FLJ13114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13114 BINDING SITE, designated SEQ ID:23748, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM

RNA, also designated SEQ ID:4037.

[47055] Another function of VGAM1326 is therefore inhibition of FLJ13114 (Accession NM_024541). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13114. FLJ13197 (Accession NM_024614) is another VGAM1326 host target gene. FLJ13197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13197 BINDING SITE, designated SEQ ID:23871, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47056] Another function of VGAM1326 is therefore inhibition of FLJ13197 (Accession NM_024614). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13197. FLJ13456 (Accession XM_038291) is another VGAM1326 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32796, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47057] Another function of VGAM1326 is therefore inhibition of FLJ13456 (Accession XM_038291). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. FLJ14442 (Accession NM_032785) is another VGAM1326 host target gene. FLJ14442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:26533, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47058] Another function of VGAM1326 is therefore inhibition of FLJ14442 (Accession NM_032785). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ14442. FLJ20004 (Accession XM_170889) is another VGAM1326 host target gene. FLJ20004 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20004 BINDING SITE, designated SEQ ID:45645, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47059] Another function of VGAM1326 is therefore inhibition of FLJ20004 (Accession XM_170889). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20004. FLJ22531 (Accession NM_024650) is another VGAM1326 host target gene. FLJ22531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:23943, to the nucleotide

sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47060] Another function of VGAM1326 is therefore inhibition of FLJ22531 (Accession NM_024650). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531. FLJ23263 (Accession NM_025115) is another VGAM1326 host target gene. FLJ23263 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23263 BINDING SITE, designated SEQ ID:24765, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47061] Another function of VGAM1326 is therefore inhibition of FLJ23263 (Accession NM_025115). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23263. FLJ31101 (Accession NM_017964) is another VGAM1326 host target gene. FLJ31101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ31101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31101 BINDING SITE, designated SEQ ID:19682, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47062] Another function of VGAM1326 is therefore inhibition of FLJ31101 (Accession NM_017964). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31101. GBTS1 (Accession NM_145173) is another VGAM1326 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29732, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47063] Another function of VGAM1326 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of

VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1. GL004 (Accession XM_038373) is another VGAM1326 host target gene. GL004 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GL004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GL004 BINDING SITE, designated SEQ ID:32830, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47064] Another function of VGAM1326 is therefore inhibition of GL004 (Accession XM_038373). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GL004. KIAA0417 (Accession XM_048898) is another VGAM1326 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE,

designated SEQ ID:35294, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47065] Another function of VGAM1326 is therefore inhibition of KIAA0417 (Accession XM_048898). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0475 (Accession NM_014864) is another VGAM1326 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:16946, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47066] Another function of VGAM1326 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA0561 (Accession XM_038150) is another VGAM1326 host target gene. KIAA0561 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32763, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47067] Another function of VGAM1326 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA0594 (Accession XM_036117) is another VGAM1326 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32385, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47068] Another function of VGAM1326 is therefore inhibition of

KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA0720 (Accession XM_030970) is another VGAM1326 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31230, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47069] Another function of VGAM1326 is therefore inhibition of KIAA0720 (Accession XM_030970). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0720. KIAA1054 (Accession XM_043493) is another VGAM1326 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33952, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47070] Another function of VGAM1326 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1143 (Accession XM_044014) is another VGAM1326 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34071, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47071] Another function of VGAM1326 is therefore inhibition of KIAA1143 (Accession XM_044014). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. KIAA1373 (Accession XM_048195) is another

VGAM1326 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35122, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47072] Another function of VGAM1326 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1373. KIAA1649 (Accession NM_032311) is another VGAM1326 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26102, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47073] Another function of VGAM1326 is therefore inhibition of KIAA1649 (Accession NM_032311). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1655 (Accession XM_039442) is another VGAM1326 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33081, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47074] Another function of VGAM1326 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1971 (Accession XM_058720) is another VGAM1326 host target gene. KIAA1971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1971, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE, designated SEQ ID:36727, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47075] Another function of VGAM1326 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. MGC2477 (Accession NM_024099) is another VGAM1326 host target gene. MGC2477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE, designated SEQ ID:23540, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47076] Another function of VGAM1326 is therefore inhibition of MGC2477 (Accession NM_024099). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC2477. MGC5149 (Accession XM_051200) is another VGAM1326 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:35782, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47077] Another function of VGAM1326 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. Paternally Expressed 10 (PEG10, Accession NM_015068) is another VGAM1326 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17423, to the nucleotide sequence of VGAM1326 RNA,

herein designated VGAM RNA, also designated SEQ ID:4037.

[47078] Another function of VGAM1326 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM_015068). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651) is another VGAM1326 host target gene. PELI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PELI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI1 BINDING SITE, designated SEQ ID:21814, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47079] Another function of VGAM1326 is therefore inhibition of Pellino Homolog 1 (Drosophila) (PELI1, Accession NM_020651). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI1. SCAMP-4 (Accession NM_079834) is another VGAM1326 host target gene.

SCAMP-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP-4 BINDING SITE, designated SEQ ID:27818, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47080] Another function of VGAM1326 is therefore inhibition of SCAMP-4 (Accession NM_079834). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP-4. Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM_022978) is another VGAM1326 host target gene. SERF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERF1B BINDING SITE, designated SEQ ID:23256, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4037.

[47081] Another function of VGAM1326 is therefore inhibition of Small EDRK-rich Factor 1B (centromeric) (SERF1B, Accession NM_022978). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERF1B. SS-56 (Accession XM_006063) is another VGAM1326 host target gene. SS-56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS-56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS-56 BINDING SITE, designated SEQ ID:29988, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47082] Another function of VGAM1326 is therefore inhibition of SS-56 (Accession XM_006063). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS-56. Serine/threonine Kinase 33 (STK33, Accession XM_031831) is another VGAM1326 host target gene. STK33 BINDING SITE is HOST TARGET binding site found

in the 5` untranslated region of mRNA encoded by STK33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK33 BINDING SITE, designated SEQ ID:31495, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47083] Another function of VGAM1326 is therefore inhibition of Serine/threonine Kinase 33 (STK33, Accession XM_031831). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK33. SUN1 (Accession NM_025154) is another VGAM1326 host target gene. SUN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SUN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUN1 BINDING SITE, designated SEQ ID:24792, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47084] Another function of VGAM1326 is therefore inhibition of

SUN1 (Accession NM_025154). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUN1. LOC112724 (Accession NM_138412) is another VGAM1326 host target gene. LOC112724 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC112724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112724 BINDING SITE, designated SEQ ID:28778, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47085] Another function of VGAM1326 is therefore inhibition of LOC112724 (Accession NM_138412). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112724. LOC112817 (Accession NM_138413) is another VGAM1326 host target gene. LOC112817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112817, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC112817 BINDING SITE, designated SEQ ID:28780, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47086] Another function of VGAM1326 is therefore inhibition of LOC112817 (Accession NM_138413). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112817. LOC135398 (Accession XM_069333) is another VGAM1326 host target gene. LOC135398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135398 BINDING SITE, designated SEQ ID:37385, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47087] Another function of VGAM1326 is therefore inhibition of LOC135398 (Accession XM_069333). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135398. LOC146050 (Accession XM_085301) is an-

other VGAM1326 host target gene. LOC146050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146050 BINDING SITE, designated SEQ ID:38053, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47088] Another function of VGAM1326 is therefore inhibition of LOC146050 (Accession XM_085301). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146050. LOC152220 (Accession XM_098176) is another VGAM1326 host target gene. LOC152220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE, designated SEQ ID:41440, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47089] Another function of VGAM1326 is therefore inhibition of LOC152220 (Accession XM_098176). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC152300 (Accession XM_087432) is another VGAM1326 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39249, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47090] Another function of VGAM1326 is therefore inhibition of LOC152300 (Accession XM_087432). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC158293 (Accession XM_088541) is another VGAM1326 host target gene. LOC158293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158293, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158293 BINDING SITE, designated SEQ ID:39807, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47091] Another function of VGAM1326 is therefore inhibition of LOC158293 (Accession XM_088541). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158293. LOC196264 (Accession XM_113683) is another VGAM1326 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42331, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47092] Another function of VGAM1326 is therefore inhibition of LOC196264 (Accession XM_113683). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196264. LOC200316 (Accession XM_114205) is another VGAM1326 host target gene. LOC200316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200316 BINDING SITE, designated SEQ ID:42795, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47093] Another function of VGAM1326 is therefore inhibition of LOC200316 (Accession XM_114205). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200316. LOC200471 (Accession XM_117234) is another VGAM1326 host target gene. LOC200471 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200471 BINDING SITE, designated SEQ ID:43304, to the nucleotide sequence of VGAM1326 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4037.

[47094] Another function of VGAM1326 is therefore inhibition of LOC200471 (Accession XM_117234). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200471. LOC202908 (Accession XM_114602) is another VGAM1326 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42994, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47095] Another function of VGAM1326 is therefore inhibition of LOC202908 (Accession XM_114602). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC203350 (Accession XM_117536) is another VGAM1326 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43529, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47096] Another function of VGAM1326 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC220074 (Accession NM_145309) is another VGAM1326 host target gene. LOC220074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:29822, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47097] Another function of VGAM1326 is therefore inhibition of LOC220074 (Accession NM_145309). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC220074. LOC221477 (Accession XM_166397) is another VGAM1326 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44259, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47098] Another function of VGAM1326 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC254249 (Accession XM_170931) is another VGAM1326 host target gene. LOC254249 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254249 BINDING SITE, designated SEQ ID:45712, to

the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47099] Another function of VGAM1326 is therefore inhibition of LOC254249 (Accession XM_170931). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254249. LOC50999 (Accession NM_016040) is another VGAM1326 host target gene. LOC50999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC50999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC50999 BINDING SITE, designated SEQ ID:18119, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47100] Another function of VGAM1326 is therefore inhibition of LOC50999 (Accession NM_016040). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC50999. LOC90141 (Accession XM_029373) is another VGAM1326 host target gene. LOC90141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC90141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90141 BINDING SITE, designated SEQ ID:30879, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47101] Another function of VGAM1326 is therefore inhibition of LOC90141 (Accession XM_029373). Accordingly, utilities of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141. LOC93276 (Accession XM_050200) is another VGAM1326 host target gene. LOC93276 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93276 BINDING SITE, designated SEQ ID:35589, to the nucleotide sequence of VGAM1326 RNA, herein designated VGAM RNA, also designated SEQ ID:4037.

[47102] Another function of VGAM1326 is therefore inhibition of LOC93276 (Accession XM_050200). Accordingly, utilities

of VGAM1326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1327 (VGAM1327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47103] VGAM1327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1327 was detected is described hereinabove with reference to Figs. 1-8.

[47104] VGAM1327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47105] VGAM1327 gene encodes a VGAM1327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1327 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1327 precursor RNA is designated SEQ ID:1313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1313 is located at position 86115 relative to the genome of Myxoma Virus.

- [47106] VGAM1327 precursor RNA folds onto itself, forming VGAM1327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47107] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1327 folded precursor RNA into VGAM1327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1327 RNA is designated SEQ ID:4038, and

is provided hereinbelow with reference to the sequence listing part.

[47108] VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1327 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[47109] VGAM1327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1327 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47110] The complementary binding of VGAM1327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1327 host target RNA into VGAM1327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47111] It is appreciated that VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1327 host target genes. The mRNA of each one of this plurality of VGAM1327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1327 RNA, herein designated VGAM RNA, and which when bound by VGAM1327 RNA causes inhibition of translation of respective one or more VGAM1327 host target proteins.

[47112] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1327 gene, herein designated VGAM GENE, on one or more VGAM1327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47113] It is yet further appreciated that a function of VGAM1327 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1327 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1327 correlate with, and may be deduced from, the identity of the host target genes which VGAM1327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47114] Nucleotide sequences of the VGAM1327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1327 are further described hereinbelow with reference to Table 1.

[47115] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1327 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47116] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1327 gene, herein designated VGAM is inhibition of expression of VGAM1327 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1327 correlate with, and may be deduced from, the identity of the target genes which VGAM1327 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47117] Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403) is a VGAM1327 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32256, to the nucleotide sequence of VGAM1327 RNA, herein designated VGAM RNA, also designated SEQ ID:4038.

[47118] A function of VGAM1327 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM1327 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with CORO2B. The function of CORO2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM923. Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269) is another VGAM1327 host target gene. LEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEF1 BINDING SITE, designated SEQ ID:18391, to the nucleotide sequence of VGAM1327 RNA, herein designated VGAM RNA, also designated SEQ ID:4038.

[47119] Another function of VGAM1327 is therefore inhibition of Lymphoid Enhancer-binding Factor 1 (LEF1, Accession NM_016269), a gene which plays an essential role in the formation of several organs and structures that require inductive tissue interactions. Accordingly, utilities of VGAM1327 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEF1. The function of LEF1 and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1328 (VGAM1328) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47120] VGAM1328 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1328 was detected is described hereinabove with reference to Figs. 1-8.

[47121] VGAM1328 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Myxoma Virus. VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47122] VGAM1328 gene encodes a VGAM1328 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1328 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1328 precursor RNA is designated SEQ ID:1314, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1314 is located at position 84471 relative to the genome of Myxoma Virus.

- [47123] VGAM1328 precursor RNA folds onto itself, forming VGAM1328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47124] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1328 folded precursor RNA into VGAM1328 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1328 RNA is designated SEQ ID:4039, and

is provided hereinbelow with reference to the sequence listing part.

[47125] VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1328 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[47126] VGAM1328 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1328 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1328 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47127] The complementary binding of VGAM1328 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1328 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1328 host target RNA into VGAM1328 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47128] It is appreciated that VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1328 host target genes. The mRNA of each one of this plurality of VGAM1328 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1328 RNA, herein designated VGAM RNA, and which when bound by VGAM1328 RNA causes inhibition of translation of respective one or more VGAM1328 host target proteins.

[47129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1328 gene, herein designated VGAM GENE, on one or more VGAM1328 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47130] It is yet further appreciated that a function of VGAM1328 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of viral infection by Myxoma Virus. Specific functions, and accordingly utilities, of VGAM1328 correlate with, and may be deduced from, the identity of the host target genes which VGAM1328 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47131] Nucleotide sequences of the VGAM1328 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1328 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1328 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1328 are further described hereinbelow with reference to Table 1.

[47132] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1328 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1328 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47133] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1328 gene, herein designated VGAM is inhibition of expression of VGAM1328 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1328 correlate with, and may be deduced from, the identity of the target genes which VGAM1328 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47134] Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is a VGAM1328 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7994, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47135] A function of VGAM1328 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession

XM_044421) is another VGAM1328 host target gene. SLC19A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC19A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A2 BINDING SITE, designated SEQ ID:34195, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47136] Another function of VGAM1328 is therefore inhibition of Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A2. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM1328 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE,

designated SEQ ID:27534, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47137] Another function of VGAM1328 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM_097736) is another VGAM1328 host target gene. C20orf82 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf82, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf82 BINDING SITE, designated SEQ ID:41084, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47138] Another function of VGAM1328 is therefore inhibition of Chromosome 20 Open Reading Frame 82 (C20orf82, Accession XM_097736). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf82.

KIAA0217 (Accession XM_040265) is another VGAM1328 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33277, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47139] Another function of VGAM1328 is therefore inhibition of KIAA0217 (Accession XM_040265). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0729 (Accession XM_171027) is another VGAM1328 host target gene. KIAA0729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0729 BINDING SITE, designated SEQ ID:45806, to the

nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47140] Another function of VGAM1328 is therefore inhibition of KIAA0729 (Accession XM_171027). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0729. LOC253017 (Accession XM_171068) is another VGAM1328 host target gene. LOC253017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253017 BINDING SITE, designated SEQ ID:45870, to the nucleotide sequence of VGAM1328 RNA, herein designated VGAM RNA, also designated SEQ ID:4039.

[47141] Another function of VGAM1328 is therefore inhibition of LOC253017 (Accession XM_171068). Accordingly, utilities of VGAM1328 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1329 (VGAM1329) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47142] VGAM1329 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1329 was detected is described hereinabove with reference to Figs. 1–8.

[47143] VGAM1329 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Virus C. VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47144] VGAM1329 gene encodes a VGAM1329 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1329 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1329 precursor RNA is designated SEQ ID:1315, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1315 is located at position 7174 relative to the genome of Garlic Virus C.

[47145] VGAM1329 precursor RNA folds onto itself, forming VGAM1329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47146] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1329 folded precursor RNA into VGAM1329 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1329 RNA is designated SEQ ID:4040, and is provided hereinbelow with reference to the sequence listing part.

[47147] VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1329 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1329 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47148] VGAM1329 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1329 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1329 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47149] The complementary binding of VGAM1329 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1329 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1329 host target RNA into VGAM1329 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47150] It is appreciated that VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1329 host target genes. The mRNA of each one of this plurality of VGAM1329 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1329 RNA, herein designated VGAM RNA, and which when bound by VGAM1329 RNA causes inhibition of translation of respective one or more VGAM1329 host target proteins.

[47151] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1329 gene, herein designated VGAM GENE, on one or more VGAM1329 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47152] It is yet further appreciated that a function of VGAM1329 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of viral infection by Garlic Virus C. Specific functions, and accordingly utilities, of VGAM1329 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1329 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47153] Nucleotide sequences of the VGAM1329 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1329 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1329 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1329 are further described hereinbelow with reference to Table 1.

[47154] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1329 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1329 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47155] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1329 gene, herein designated VGAM is inhibition of expression of VGAM1329 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1329 correlate with, and may be deduced from, the identity of the target genes which VGAM1329

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47156] Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM_015511) is a VGAM1329 host target gene.

C20orf4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf4 BINDING SITE, designated SEQ ID:17770, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47157] A function of VGAM1329 is therefore inhibition of Chromosome 20 Open Reading Frame 4 (C20orf4, Accession NM_015511). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf4. Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586) is another VGAM1329 host target gene. C9orf7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf7, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf7 BINDING SITE, designated SEQ ID:19034, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47158] Another function of VGAM1329 is therefore inhibition of Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf7. DKFZP762D096 (Accession XM_037662) is another VGAM1329 host target gene. DKFZP762D096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP762D096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP762D096 BINDING SITE, designated SEQ ID:32663, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47159] Another function of VGAM1329 is therefore inhibition of DKFZP762D096 (Accession XM_037662). Accordingly, utilities of VGAM1329 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP762D096. FLJ10829 (Accession NM_018234) is another VGAM1329 host target gene. FLJ10829 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10829 BINDING SITE, designated SEQ ID:20176, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47160] Another function of VGAM1329 is therefore inhibition of FLJ10829 (Accession NM_018234). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10829. KIAA0255 (Accession NM_014742) is another VGAM1329 host target gene. KIAA0255 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0255 BINDING SITE, designated SEQ ID:16412, to the

nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47161] Another function of VGAM1329 is therefore inhibition of KIAA0255 (Accession NM_014742). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. LOC143909 (Accession XM_096506) is another VGAM1329 host target gene. LOC143909 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143909 BINDING SITE, designated SEQ ID:40386, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47162] Another function of VGAM1329 is therefore inhibition of LOC143909 (Accession XM_096506). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143909. LOC151996 (Accession XM_098151) is another VGAM1329 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41411, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47163] Another function of VGAM1329 is therefore inhibition of LOC151996 (Accession XM_098151). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC254042 (Accession XM_171022) is another VGAM1329 host target gene. LOC254042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254042 BINDING SITE, designated SEQ ID:45790, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47164] Another function of VGAM1329 is therefore inhibition of LOC254042 (Accession XM_171022). Accordingly, utilities

of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254042. LOC256158 (Accession XM_175125) is another VGAM1329 host target gene. LOC256158 BINDING SITE1 and LOC256158 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC256158, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE1 and LOC256158 BINDING SITE2, designated SEQ ID:46614 and SEQ ID:46615 respectively, to the nucleotide sequence of VGAM1329 RNA, herein designated VGAM RNA, also designated SEQ ID:4040.

[47165] Another function of VGAM1329 is therefore inhibition of LOC256158 (Accession XM_175125). Accordingly, utilities of VGAM1329 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1330 (VGAM1330) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[47166] VGAM1330 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1330 was detected is described hereinabove with reference to Figs. 1–8.

[47167] VGAM1330 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A. VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47168] VGAM1330 gene encodes a VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1330 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1330 precursor RNA is designated SEQ ID:1316, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1316 is located at position 27688 relative to the genome of Human Adenovirus A.

[47169] VGAM1330 precursor RNA folds onto itself, forming VGAM1330 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47170] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1330 folded precursor RNA into VGAM1330 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1330 RNA is designated SEQ ID:4041, and is provided hereinbelow with reference to the sequence listing part.

[47171] VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1330 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47172] VGAM1330 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1330 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1330 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47173] The complementary binding of VGAM1330 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1330 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1330 host target RNA into VGAM1330 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47174] It is appreciated that VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1330 host target genes. The mRNA of each one of this plurality of VGAM1330 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1330 RNA, herein designated VGAM RNA, and which when bound by VGAM1330 RNA causes inhibition of translation of respective one or more VGAM1330 host target proteins.

[47175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1330 gene, herein designated VGAM GENE, on one or more VGAM1330 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47176] It is yet further appreciated that a function of VGAM1330 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of viral infection by Human Adenovirus A. Specific functions, and accordingly utilities, of VGAM1330 correlate with, and may be deduced from, the identity of the host target genes which VGAM1330 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[47177] Nucleotide sequences of the VGAM1330 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1330 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1330 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1330 are further described hereinbelow with reference to Table 1.

[47178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1330 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1330 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47179] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1330 gene, herein designated VGAM is inhibition of expression of VGAM1330 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1330 correlate with, and may be deduced from, the identity of the target genes which VGAM1330 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47180] SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession NM_003071) is a VGAM1330 host target gene. SMARCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA3 BINDING SITE, designated SEQ ID:9039, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47181] A function of VGAM1330 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession NM_003071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCA3. The function of SMARCA3 has been established by previous studies. Chromatin remodeling enzymes are implicated in a variety of important cellular functions. Various components of chromatin remodeling complexes,

including several members of the SWI/SNF family, are disrupted in cancer. Moinova et al. (2002) identified the HLTF gene (SMARCA3) as a target for gene inactivation in colon cancer. Loss of HLTF expression accompanied by HLTF promoter methylation was noted in 9 of 34 colon cancer cell lines. In these cell lines, HLTF expression was restored by treatment with the demethylating agent 5-azacytidine. In further studies of primary colon cancer tissues, HLTF methylation was detected in 27 of 63 cases (43%). No methylation of HLTF was detected in breast or lung cancers, suggesting selection for HLTF methylation in colonic malignancies. Transfection of HLTF suppressed 75% of colon growth in each of 3 different HLTF-deficient cell lines, but showed no suppressive effect in any of 3 HLTF-proficient cell lines. These findings showed that HLTF is a common target for methylation and epigenetic gene silencing in colon cancer and suggested HLTF as a candidate colon cancer suppressor gene.

[47182] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47183] Moinova, H. R.; Chen, W.-D.; Shen, L.; Smiraglia, D.; Olechnowicz, J.; Ravi, L.; Kasturi, L.; Myeroff, L.; Plass, C.;

Parsons, R.; Minna, J.; Willson, J. K. V.; Green, S. B.; Issa, J.-P.; Markowitz, S. D. : HLTF gene silencing in human colon cancer. Proc. Nat. Acad. Sci. 99: 4562–4567, 2002. ; and

[47184] Sheridan, P. L.; Schorpp, Ding, H.; Descheemaeker, K.; Marynen, P.; Nelles, L.; Carvalho, T.; Carmo-Fonseca, M.; Collen, D.; Belayew, A. : Characterization of a helicase-like transcrip.

[47185] Further studies establishing the function and utilities of SMARCA3 are found in John Hopkins OMIM database record ID 603257, and in cited publications numbered 8496–8499 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thromboxane A2 Receptor (TBXA2R, Accession NM_001060) is another VGAM1330 host target gene. TBXA2R BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6726, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ

ID:4041.

[47186] Another function of VGAM1330 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM_001060), a gene which activates Ca^{2+} -activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM433.FLJ22843 (Accession NM_025184) is another VGAM1330 host target gene. FLJ22843 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22843 BINDING SITE, designated SEQ ID:24820, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47187] Another function of VGAM1330 is therefore inhibition of FLJ22843 (Accession NM_025184). Accordingly, utilities of

VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22843. KIAA1465 (Accession XM_027396) is another VGAM1330 host target gene. KIAA1465 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1465 BINDING SITE, designated SEQ ID:30499, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47188] Another function of VGAM1330 is therefore inhibition of KIAA1465 (Accession XM_027396). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1465. KIAA1958 (Accession XM_088566) is another VGAM1330 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1958 BINDING SITE, designated SEQ ID:39833, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47189] Another function of VGAM1330 is therefore inhibition of KIAA1958 (Accession XM_088566). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. PRO1770 (Accession NM_014100) is another VGAM1330 host target gene. PRO1770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1770 BINDING SITE, designated SEQ ID:15327, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47190] Another function of VGAM1330 is therefore inhibition of PRO1770 (Accession NM_014100). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1770. PTD012 (Accession NM_014039) is another VGAM1330 host target gene. PTD012 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTD012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD012 BINDING SITE, designated SEQ ID:15268, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47191] Another function of VGAM1330 is therefore inhibition of PTD012 (Accession NM_014039). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD012. Sorting Nexin 10 (SNX10, Accession NM_013322) is another VGAM1330 host target gene. SNX10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX10 BINDING SITE, designated SEQ ID:14969, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47192] Another function of VGAM1330 is therefore inhibition of

Sorting Nexin 10 (SNX10, Accession NM_013322). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX10. Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM_014574) is another VGAM1330 host target gene. STRN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRN3 BINDING SITE, designated SEQ ID:15934, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47193] Another function of VGAM1330 is therefore inhibition of Striatin, Calmodulin Binding Protein 3 (STRN3, Accession NM_014574). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRN3. LOC221931 (Accession XM_168348) is another VGAM1330 host target gene. LOC221931 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221931, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221931 BINDING SITE, designated SEQ ID:45120, to the nucleotide sequence of VGAM1330 RNA, herein designated VGAM RNA, also designated SEQ ID:4041.

[47194] Another function of VGAM1330 is therefore inhibition of LOC221931 (Accession XM_168348). Accordingly, utilities of VGAM1330 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221931. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1331 (VGAM1331) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47195] VGAM1331 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1331 was detected is described hereinabove with reference to Figs. 1-8.

[47196] VGAM1331 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A.

VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47197] VGAM1331 gene encodes a VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1331 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1331 precursor RNA is designated SEQ ID:1317, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1317 is located at position 25669 relative to the genome of Human Adenovirus A.

[47198] VGAM1331 precursor RNA folds onto itself, forming VGAM1331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47199] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1331 folded precursor RNA into VGAM1331 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1331 RNA is designated SEQ ID:4042, and is provided hereinbelow with reference to the sequence listing part.

[47200] VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1331 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47201] VGAM1331 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1331 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1331 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47202] The complementary binding of VGAM1331 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1331 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1331 host target RNA into VGAM1331 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47203] It is appreciated that VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1331 host target genes. The mRNA of each one of this plurality of VGAM1331 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1331 RNA, herein designated VGAM RNA, and which when bound by VGAM1331 RNA causes inhibition of translation of respective one or more VGAM1331 host target proteins.

[47204] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1331 gene, herein designated VGAM GENE, on one or more VGAM1331 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47205] It is yet further appreciated that a function of VGAM1331 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1331 include diagnosis, prevention and treatment of viral infection by Human Adenovirus A. Specific functions, and accordingly utilities, of VGAM1331 correlate with, and may be deduced from, the identity of the host target genes which VGAM1331 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47206] Nucleotide sequences of the VGAM1331 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1331 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1331 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1331 are further described hereinbelow with reference to Table 1.

[47207] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1331 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1331 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47208] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1331 gene, herein designated VGAM is inhibition of expression of VGAM1331 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1331 correlate with, and may be deduced from, the identity of the target genes which VGAM1331 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47209] Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191) is a VGAM1331 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ

ID:42770, to the nucleotide sequence of VGAM1331 RNA, herein designated VGAM RNA, also designated SEQ ID:4042.

[47210] A function of VGAM1331 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM_114191). Accordingly, utilities of VGAM1331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. LOC168391 (Accession XM_095061) is another VGAM1331 host target gene. LOC168391 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168391 BINDING SITE, designated SEQ ID:40243, to the nucleotide sequence of VGAM1331 RNA, herein designated VGAM RNA, also designated SEQ ID:4042.

[47211] Another function of VGAM1331 is therefore inhibition of LOC168391 (Accession XM_095061). Accordingly, utilities of VGAM1331 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168391. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1332 (VGAM1332) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47212] VGAM1332 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1332 was detected is described hereinabove with reference to Figs. 1–8.

[47213] VGAM1332 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A. VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47214] VGAM1332 gene encodes a VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1332 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1332 precursor RNA is designated SEQ ID:1318, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1318 is located at position 26522 relative to the genome of Human Adenovirus A.

[47215] VGAM1332 precursor RNA folds onto itself, forming VGAM1332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1332 folded precursor RNA into VGAM1332 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1332 RNA is designated SEQ ID:4043, and is provided hereinbelow with reference to the sequence listing part.

[47217] VGAM1332 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1332 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47218] VGAM1332 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1332 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1332 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1332 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[47219] The complementary binding of VGAM1332 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1332 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1332 host target RNA into VGAM1332 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47220] It is appreciated that VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1332 host target genes. The mRNA of each one of this plurality of VGAM1332 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1332 RNA, herein designated VGAM RNA, and which when bound by VGAM1332 RNA causes inhibition of translation of respective one or more

VGAM1332 host target proteins.

[47221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1332 gene, herein designated VGAM GENE, on one or more VGAM1332 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47222] It is yet further appreciated that a function of VGAM1332 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of viral infection by Human Adenovirus A. Spe-

cific functions, and accordingly utilities, of VGAM1332 correlate with, and may be deduced from, the identity of the host target genes which VGAM1332 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47223] Nucleotide sequences of the VGAM1332 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1332 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1332 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1332 are further described hereinbelow with reference to Table 1.

[47224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1332 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1332 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1332 gene, herein designated VGAM is inhibition of expression of VGAM1332 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1332 correlate with, and may be deduced from, the identity of the target genes which VGAM1332 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47226] Chloride Channel 3 (CLCN3, Accession NM_001829) is a VGAM1332 host target gene. CLCN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN3 BINDING SITE, designated SEQ ID:7563, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47227] A function of VGAM1332 is therefore inhibition of Chloride Channel 3 (CLCN3, Accession NM_001829), a gene which play a role in the neural cell function through regulation of membrane excitability. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN3. The function of CLCN3 has been established by previous studies. Cid et al. (1995) cloned a human homolog of the rat voltage-gated chloride channel CLC2 from a T84 ep-

ithelial cell cDNA library. The predicted 898–amino acid protein is over 93% identical to the rat sequence. The gene was mapped to 3q26–qter by PCR of somatic cell hybrid DNAs. Schwiebert et al. (1998) found that CLC2 chloride channels are expressed in epithelia affected by cystic fibrosis (CF; 219700) and raised the possibility that these might represent an alternative target for pharmacotherapy of CF. To explore this possibility, they manipulated genetically the expression levels of CLC2 channels in airway epithelial cells derived from cystic fibrosis patients.

Whole–cell patch–clamp analysis of cells overexpressing CLC2 identified hyperpolarization–activated chloride ion currents (HACCs) that displayed time– and voltage–dependent activation and an inwardly rectifying steady–state current voltage relationship. Reduction of extracellular pH to 5.0 caused significant increases in HACCs in overexpressing cells and the appearance of robust currents in parental cells from the cystic fibrosis patient. CF cells stably transfected with the antisense CLC2 cDNA showed reduced expression of CLC2 compared with parental cells by Western blotting, and a significant reduction in the magnitude of pH–dependent HACCs. To determine whether changes in the extracellular pH alone could initiate chlo–

ride transport via CLC2 channels, they performed chloride-36 efflux studies on overexpressing cells and cells with endogenous expression of CLC2. Acidic extracellular pH increased chloride-36 efflux rates in both cell types, although the CLC2-overexpressing cells had significantly greater chloride conduction and a longer duration of efflux than the parental cells. Compounds that exploit the pH mechanism of activating endogenous CLC2 channels may provide a pharmacologic option for increasing chloride conductance in airways of CF patients.

[47228] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47229] Cid, L. P.; Montrose-Rafizadeh, C.; Smith, D. I.; Guggino, W. B.; Cutting, G. R. : Cloning of a putative human voltage-gated chloride channel (CLC-2) cDNA widely expressed in human tissues. *Hum. Molec. Genet.* 4: 407-413, 1995. ; and

[47230] Schwiebert, E. M.; Cid-Soto, L. P.; Stafford, D.; Carter, M.; Blaisdell, C. J.; Zeitlin, P. L.; Guggino, W. B.; Cutting, G. R. : Analysis of CLC-2 channels as an alternative pathway for.

[47231] Further studies establishing the function and utilities of CLCN3 are found in John Hopkins OMIM database record

ID 600580, and in cited publications numbered 10180–10183, 377 and 10184 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interferon Regulatory Factor 2 (IRF2, Accession NM_002199) is another VGAM1332 host target gene. IRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRF2 BINDING SITE, designated SEQ ID:7956, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47232] Another function of VGAM1332 is therefore inhibition of Interferon Regulatory Factor 2 (IRF2, Accession NM_002199), a gene which is a transcriptional activator of type I interferon and interferon-inducible genes. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRF2. The function of IRF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM511. LIM Domain Containing Pre-

ferred Translocation Partner In Lipoma (LPP, Accession NM_005578) is another VGAM1332 host target gene. LPP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:12106, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47233] Another function of VGAM1332 is therefore inhibition of LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM_005578). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP. Membrane Metallo-endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007288) is another VGAM1332 host target gene. MME BINDING SITE1 through MME BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MME, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of MME BINDING SITE1 through MME BINDING SITE4, designated SEQ ID:14152, SEQ ID:6600, SEQ ID:14148 and SEQ ID:14156 respectively, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47234] Another function of VGAM1332 is therefore inhibition of Membrane Metallo–endopeptidase (neutral endopeptidase, enkephalinase, CALLA, CD10) (MME, Accession NM_007288), a gene which is thermolysin–like specificity. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MME. The function of MME has been established by previous studies. Common acute lymphocytic leukemia antigen is an important cell surface marker in the diagnosis of human acute lymphocytic leukemia (ALL). It is present on leukemic cells of pre–B phenotype, which represent 85% of cases of ALL. CALLA is not restricted to leukemic cells, however, and is found on a variety of normal tissues. CALLA is a glycoprotein that is particularly abundant in kidney, where it is present on the brush border of proximal tubules and on glomerular epithelium. Letarte et al. (1988) cloned a cDNA coding for

CALLA and showed that the amino acid sequence deduced from the cDNA sequence is identical to that of human membrane-associated neutral endopeptidase (NEP; EC 3.4.24.11), also known as enkephalinase. NEP cleaves peptides at the amino side of hydrophobic residues and inactivates several peptide hormones including glucagon, enkephalins, substance P, neurotensin, oxytocin, and bradykinin. By cDNA transfection analysis, Shipp et al. (1989) confirmed that CALLA is a functional neutral endopeptidase of the type that has previously been called enkephalinase. Barker et al. (1989) demonstrated that the CALLA gene, which encodes a 100-kD type II transmembrane glycoprotein, exists in a single copy of greater than 45 kb which is not rearranged in malignancies expressing cell surface CALLA. D'Adamio et al. (1989) demonstrated that the CALLA gene spans more than 80 kb and is composed of 24 exons. Animal model experiments lend further support to the function of MME. Amyloid-beta peptide (OMIM Ref. No. 104760), the pathogenic agent of Alzheimer disease (OMIM Ref. No. 104300), is a physiologic metabolite in the brain. Iwata et al. (2001) examined the role of neprilysin, a candidate amyloid-beta degrading peptidase, in the metabolism using neprilysin gene-

disrupted mice. Neprilysin deficiency resulted in defects both in the degradation of exogenously administered amyloid-beta and in the metabolic suppression of the endogenous amyloid-beta levels in a gene dose-dependent manner. The regional levels of amyloid-beta in the neprilysin-deficient mouse brain were in the distinct order of hippocampus, cortex, thalamus/striatum, and cerebellum, where hippocampus has the highest level and cerebellum the lowest, correlating with the vulnerability to amyloid-beta deposition in brains of humans with Alzheimer disease. Iwata et al. (2001) concluded that even partial downregulation of neprilysin activity, which could be caused by aging, can contribute to Alzheimer disease by promoting amyloid-beta accumulation.

[47235] It is appreciated that the abovementioned animal model for MME is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[47236] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47237] Iwata, N.; Tsubuki, S.; Takaki, Y.; Shirotani, K.; Lu, B.; Gerard, N. P.; Gerard, C.; Hama, E.; Lee, H.-J.; Saido, T. C. :

Metabolic regulation of brain A-beta by neprilysin. Science 292: 1550-1552, 2001. ; and

[47238] Letarte, M.; Vera, S.; Tran, R.; Addis, J. B. L.; Onizuka, R. J.; Quackenbush, E. J.; Jongeneel, C. V.; McInnes, R. R. : Common acute lymphocytic leukemia antigen is identical to neutr.

[47239] Further studies establishing the function and utilities of MME are found in John Hopkins OMIM database record ID 120520, and in cited publications numbered 12226-12228, 413 and 12229-12231 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoblastoma Binding Protein 8 (RBBP8, Accession NM_002894) is another VGAM1332 host target gene. RBBP8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RBBP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP8 BINDING SITE, designated SEQ ID:8801, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47240] Another function of VGAM1332 is therefore inhibition of

Retinoblastoma Binding Protein 8 (RBBP8, Accession NM_002894), a gene which may be a tumor suppressor. Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP8. The function of RBBP8 has been established by previous studies. Fusco et al. (1998) described the isolation and characterization of a cDNA encoding a polypeptide, named RIM for 'retinoblastoma-interacting myosin-like,' that interacted in a yeast 2-hybrid system as well as in mammalian cells with the retinoblastoma (RB; 180200) protein. The RIM cDNA predicts a 897-amino acid polypeptide containing 2 leucine zipper motifs, an RB-binding domain, and a CTBP (see OMIM Ref. No. 602618)-binding domain. The RIM protein has weak homology to myosin family (see OMIM Ref. No. 160720) proteins throughout its length. Northern blot analysis revealed a ubiquitously expressed 3.6-kb mRNA. Immunoprecipitation experiments revealed that a truncated RIM protein containing amino acids 142-897 interacts with RB in mammalian cells. To understand the mechanism by which interaction between E1A and CTBP results in tumorigenesis-restraining activity, Schaeper et al. (1998) searched for cellular proteins that complex with CTBP. By

a yeast 2-hybrid screen and RACE PCR, Schaeper et al. (1998) identified and cloned a CTBP-interacting protein (CTIP). CTIP contains a 5-amino acid motif, the PLDLS motif, that is highly conserved among E1A proteins of all human adenoviruses. CTIP binds to CTBP via the PLDLS motif. Yu et al. (1998) used the Sos recruitment system to screen for proteins that bind to the region of BRCA1 (OMIM Ref. No. 113705) containing the BRCT domains. Yu et al. (1998) found that the BRCT domains interact in vivo with CTIP, a protein identified on the basis of its association with the CTBP transcriptional corepressor (Schaeper et al., 1998). Yu et al. (1998) concluded that BRCA1 regulates gene expression, at least in part, by modulating CTBP-mediated transcriptional repression. Moreover, Yu et al. (1998) found that the in vivo interaction between BRCA1 and CTIP is completely ablated by each of 3 independent tumor-associated mutations affecting the BRCT motifs of BRCA1. Yu et al. (1998) concluded that BRCA1-CTIP interaction may be required for tumor suppression by BRCA1.

[47241] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [47242] Fusco, C.; Reymond, A.; Zervos, A. S. : Molecular cloning and characterization of a novel retinoblastoma-binding protein. *Genomics* 51: 351–358, 1998. ; and
- [47243] Yu, X.; Wu, L. C.; Bowcock, A. M.; Aronheim, A.; Baer, R. : The C-terminal (BRCT) domains of BRCA1 interact in vivo with CtIP, a protein implicated in the CtBP pathway of transcriptional.
- [47244] Further studies establishing the function and utilities of RBBP8 are found in John Hopkins OMIM database record ID 604124, and in cited publications numbered 740 and 7406–7409 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BM–002 (Accession NM_016617) is another VGAM1332 host target gene. BM–002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BM–002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM–002 BINDING SITE, designated SEQ ID:18723, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.
- [47245] Another function of VGAM1332 is therefore inhibition of

BM-002 (Accession NM_016617). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002. KIAA0855 (Accession NM_015003) is another VGAM1332 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17375, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47246] Another function of VGAM1332 is therefore inhibition of KIAA0855 (Accession NM_015003). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA0871 (Accession NM_014961) is another VGAM1332 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17331, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47247] Another function of VGAM1332 is therefore inhibition of KIAA0871 (Accession NM_014961). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0871. KIAA1843 (Accession XM_030838) is another VGAM1332 host target gene. KIAA1843 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1843 BINDING SITE, designated SEQ ID:31162, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47248] Another function of VGAM1332 is therefore inhibition of KIAA1843 (Accession XM_030838). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1843. Kelch-like 4 (Drosophila) (KLHL4, Accession

NM_019117) is another VGAM1332 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:21191, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47249] Another function of VGAM1332 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL4. OCT11 (Accession NM_014352) is another VGAM1332 host target gene. OCT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OCT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCT11 BINDING SITE, designated SEQ ID:15679, to the nucleotide sequence of VGAM1332 RNA,

herein designated VGAM RNA, also designated SEQ ID:4043.

[47250] Another function of VGAM1332 is therefore inhibition of OCT11 (Accession NM_014352). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCT11. Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842) is another VGAM1332 host target gene. SPRY2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SPRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY2 BINDING SITE, designated SEQ ID:12454, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47251] Another function of VGAM1332 is therefore inhibition of Sprouty Homolog 2 (Drosophila) (SPRY2, Accession NM_005842). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY2. Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387)

is another VGAM1332 host target gene. STRBP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by STRBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STRBP BINDING SITE, designated SEQ ID:20420, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47252] Another function of VGAM1332 is therefore inhibition of Spermatid Perinuclear RNA Binding Protein (STRBP, Accession NM_018387). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STRBP. TIP47 (Accession NM_005817) is another VGAM1332 host target gene. TIP47 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP47, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP47 BINDING SITE, designated SEQ ID:12416, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47253] Another function of VGAM1332 is therefore inhibition of TIP47 (Accession NM_005817). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP47. LOC200268 (Accession XM_114178) is another VGAM1332 host target gene. LOC200268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200268 BINDING SITE, designated SEQ ID:42763, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47254] Another function of VGAM1332 is therefore inhibition of LOC91818 (Accession XM_040878). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91818. LOC91818 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91818, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91818 BINDING SITE, designated SEQ ID:33404, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47255] Another function of VGAM1332 is therefore inhibition of LOC91818 (Accession XM_040878). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91818. LOC92573 (Accession XM_045884) is another VGAM1332 host target gene. LOC92573 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:34598, to the nucleotide sequence of VGAM1332 RNA, herein designated VGAM RNA, also designated SEQ ID:4043.

[47256] Another function of VGAM1332 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM1332 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1333 (VGAM1333) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47257] VGAM1333 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1333 was detected is described hereinabove with reference to Figs. 1–8.

[47258] VGAM1333 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A. VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47259] VGAM1333 gene encodes a VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1333 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1333 precursor RNA is designated SEQ ID:1319, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1319 is located at position 24338 relative to the genome of Human Adenovirus A.

- [47260] VGAM1333 precursor RNA folds onto itself, forming VGAM1333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [47261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1333 folded precursor RNA into VGAM1333 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1333 RNA is designated SEQ ID:4044, and is provided hereinbelow with reference to the sequence listing part.

[47262] VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1333 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47263] VGAM1333 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1333 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1333 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47264] The complementary binding of VGAM1333 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1333 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1333 host target RNA into VGAM1333 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47265] It is appreciated that VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1333 host target genes. The mRNA of each one of this plurality of VGAM1333 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1333 RNA, herein designated VGAM RNA, and which when bound by VGAM1333 RNA causes

inhibition of translation of respective one or more VGAM1333 host target proteins.

[47266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1333 gene, herein designated VGAM GENE, on one or more VGAM1333 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47267] It is yet further appreciated that a function of VGAM1333 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1333 include diagnosis, prevention and

treatment of viral infection by Human Adenovirus A. Specific functions, and accordingly utilities, of VGAM1333 correlate with, and may be deduced from, the identity of the host target genes which VGAM1333 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47268] Nucleotide sequences of the VGAM1333 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1333 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1333 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1333 are further described hereinbelow with reference to Table 1.

[47269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1333 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1333 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47270] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1333 gene, herein designated VGAM is inhibition of expression of VGAM1333 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1333 correlate with, and may be deduced from, the identity of the target genes which VGAM1333 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47271] UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778) is a VGAM1333 host target gene. B4GALT4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B4GALT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B4GALT4 BINDING SITE, designated SEQ ID:9859, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47272] A function of VGAM1333 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,4- Galactosyltransferase, Polypeptide 4 (B4GALT4, Accession NM_003778). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B4GALT4. Dystrophia Myotonica-protein Kinase (DMPK, Accession NM_004409) is another VGAM1333 host

target gene. DMPK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMPK BINDING SITE, designated SEQ ID:10664, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47273] Another function of VGAM1333 is therefore inhibition of Dystrophin Myotonic-protein Kinase (DMPK, Accession NM_004409). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMPK. Neuroepithelial Cell Transforming Gene 1 (NET1, Accession NM_005863) is another VGAM1333 host target gene. NET1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET1 BINDING SITE, designated SEQ ID:12476, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA,

also designated SEQ ID:4044.

[47274] Another function of VGAM1333 is therefore inhibition of Neuroepithelial Cell Transforming Gene 1 (NET1, Accession NM_005863), a gene which is induced morphologic alterations and conferred a malignant phenotype in vitro and in nude mice. Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET1. The function of NET1 has been established by previous studies. Pacholczyk et al. (1991) isolated a cDNA encoding a human noradrenaline transporter. The cDNA sequence predicted a protein of 617 amino acids, with 12–13 highly hydrophobic regions compatible with membrane-spanning domains. Expression of the cDNA clone in transfected HeLa cells indicated that noradrenaline transport activity is sodium-dependent and sensitive to selective noradrenaline transport inhibitors. Transporter RNA was localized to the brain stem and adrenal. The predicted protein sequence demonstrated significant amino acid identity with the Na(+)/gamma-aminobutyric acid transporter, thus identifying a new gene family for neurotransmitter transporter proteins. Pacholczyk et al. (1991) suggested that analysis of the structure and function of this trans-

porter may aid structure-based drug design for the treatment of human depression and lead to a determination of whether transporter abnormalities underlie affective disorders. By hybridization of a panel of somatic cell hybrids and by fluorescence in situ hybridization to metaphase chromosomes, Bruss et al. (1993) mapped the NET1 gene to 16q12.2. Gelernter et al. (1993) reported a TaqI RFLP at the NET1 locus. Gelernter et al. (1993) used PCR with a somatic cell hybrid panel to obtain a provisional assignment of the NET1 gene to chromosome 16. They typed the genetic polymorphism at the NET1 locus in 3 large multigenerational families and, by linkage analysis, confirmed the preliminary assignment and refined the localization to 16q, near the haptoglobin locus (HP; 140100). They then typed the NET1 RFLP on the CEPH families; the additional linkage data localized NET1 to 16q13-q21, flanked by D16S71 centromerically and HP telomerically.

[47275] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

mosome 16. Genomics 18: 690–692, 1993. ; and

[47277] Pacholczyk, T.; Blakely, R. D.; Amara, S. G. : Expression cloning of a cocaine– and antidepressant–sensitive human noradrenaline transporter. Nature 350: 350–354, 1991.

[47278] Further studies establishing the function and utilities of NET1 are found in John Hopkins OMIM database record ID 163970, and in cited publications numbered 10785–10796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoschisis (X–linked, juvenile) 1 (RS1, Accession NM_000330) is another VGAM1333 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5875, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47279] Another function of VGAM1333 is therefore inhibition of Retinoschisis (X–linked, juvenile) 1 (RS1, Accession NM_000330). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clini–

cal conditions associated with RS1. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728) is another VGAM1333 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38835, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47280] Another function of VGAM1333 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM_086728). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. DKFZP586C1619 (Accession XM_030350) is another VGAM1333 host target gene. DKFZP586C1619 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP586C1619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP586C1619 BINDING SITE, designated SEQ ID:31018, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47281] Another function of VGAM1333 is therefore inhibition of DKFZP586C1619 (Accession XM_030350). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586C1619. FLJ13593 (Accession NM_024780) is another VGAM1333 host target gene. FLJ13593 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13593 BINDING SITE, designated SEQ ID:24149, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47282] Another function of VGAM1333 is therefore inhibition of FLJ13593 (Accession NM_024780). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13593. My015 (Accession XM_039512) is another

VGAM1333 host target gene. My015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by My015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of My015 BINDING SITE, designated SEQ ID:33106, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47283] Another function of VGAM1333 is therefore inhibition of My015 (Accession XM_039512). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with My015. PIP3-E (Accession XM_039749) is another VGAM1333 host target gene. PIP3-E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIP3-E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIP3-E BINDING SITE, designated SEQ ID:33176, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47284] Another function of VGAM1333 is therefore inhibition of PIP3-E (Accession XM_039749). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP3-E. LOC129011 (Accession XM_059326) is another VGAM1333 host target gene. LOC129011 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129011, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129011 BINDING SITE, designated SEQ ID:36964, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47285] Another function of VGAM1333 is therefore inhibition of LOC129011 (Accession XM_059326). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129011. LOC204301 (Accession XM_115306) is another VGAM1333 host target gene. LOC204301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC204301, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204301 BINDING SITE, designated SEQ ID:43092, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47286] Another function of VGAM1333 is therefore inhibition of LOC204301 (Accession XM_115306). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204301. LOC253805 (Accession XM_172854) is another VGAM1333 host target gene. LOC253805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253805 BINDING SITE, designated SEQ ID:46133, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47287] Another function of VGAM1333 is therefore inhibition of LOC253805 (Accession XM_172854). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253805. LOC254358 (Accession XM_170771) is another VGAM1333 host target gene. LOC254358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254358 BINDING SITE, designated SEQ ID:45530, to the nucleotide sequence of VGAM1333 RNA, herein designated VGAM RNA, also designated SEQ ID:4044.

[47288] Another function of VGAM1333 is therefore inhibition of LOC254358 (Accession XM_170771). Accordingly, utilities of VGAM1333 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254358. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1334 (VGAM1334) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47289] VGAM1334 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1334 was detected is described hereinabove with reference to Figs. 1–8.

[47290] VGAM1334 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A. VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47291] VGAM1334 gene encodes a VGAM1334 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1334 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1334 precursor RNA is designated SEQ ID:1320, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1320 is located at position 28536 relative to the genome of Human Adenovirus A.

[47292] VGAM1334 precursor RNA folds onto itself, forming VGAM1334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47293] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1334 folded precursor RNA into VGAM1334 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1334 RNA is designated SEQ ID:4045, and is provided hereinbelow with reference to the sequence listing part.

[47294] VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1334 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[47295] VGAM1334 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1334 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1334 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[47296] The complementary binding of VGAM1334 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1334 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1334 host target RNA into VGAM1334 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47297] It is appreciated that VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1334 host target genes. The mRNA of each one of this plurality of VGAM1334 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1334 RNA, herein designated VGAM RNA, and which when bound by VGAM1334 RNA causes inhibition of translation of respective one or more VGAM1334 host target proteins.

[47298] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1334 gene, herein designated VGAM GENE, on one or more VGAM1334 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47299] It is yet further appreciated that a function of VGAM1334 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of viral infection by Human Adenovirus A. Specific functions, and accordingly utilities, of VGAM1334 correlate with, and may be deduced from, the identity of the host target genes which VGAM1334 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47300] Nucleotide sequences of the VGAM1334 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1334 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1334 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1334 are further described hereinbelow with reference to Table 1.

[47301] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1334 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1334 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[47302] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1334 gene, herein designated VGAM is inhibition of expression of VGAM1334 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1334 correlate with, and may be deduced from, the identity of the target genes which VGAM1334 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47303] Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465) is a VGAM1334 host target gene. F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F3, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F3 BINDING SITE, designated SEQ ID:33295, to the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, also designated SEQ ID:4045.

[47304] A function of VGAM1334 is therefore inhibition of Coagulation Factor III (thromboplastin, tissue factor) (F3, Accession XM_040465), a gene which functions in normal hemostasis. Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F3. The function of F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM817. Ubiquitin Specific Protease 14 (tRNA-guanine transglycosylase) (USP14, Accession NM_005151) is another VGAM1334 host target gene. USP14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP14 BINDING SITE, des-

ignated SEQ ID:11626, to the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, also designated SEQ ID:4045.

[47305] Another function of VGAM1334 is therefore inhibition of Ubiquitin Specific Protease 14 (tRNA-guanine transglycosylase) (USP14, Accession NM_005151), a gene which is similar to ubiquitin-specific cysteine (thiol) proteases and tRNA-guanine transglycosylase. Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP14. The function of USP14 has been established by previous studies. Using Tgt purified from rabbit erythrocytes, Deshpande et al. (1996) measured significant tRNA-guanine transglycosylase activity. Noting significant sequence similarity between Tgt and the deubiquitinating enzyme family, they proposed that Tgt may act as a signal to link deficiency of the transglycosylase product, queuosine, to the ubiquitin-dependent proteolytic pathway for the removal of abnormal or inappropriately expressed proteins. The International Radiation Hybrid Mapping Consortium mapped the USP14 gene to chromosome 18 (SJGC-11272). Wilson et al. (2002) stated that 2 human neurologic disorders possibly involving alterations of

synaptic function map to 18p near USP14: major affective disorder-1 (MAFD1; 125480) and schizophrenia disorder 8 (SCZD8; 603206). Animal model experiments lend further support to the function of USP14. Mice that are homozygous with respect to the spontaneous mutation ax(J) in the ataxia (ax) gene develop severe tremors by 2 to 3 weeks of age followed by hindlimb paralysis and death by 6 to 10 weeks of age. Wilson et al. (2002) showed that ax encodes Usp14, one of the large family of cysteine proteases that specifically feed ubiquitin conjugates. Although Usp14 can cleave a ubiquitin-tagged protein in vitro, it is unable to process polyubiquitin, which is believed to be associated with the protein aggregates seen in Parkinson disease, spinocerebellar ataxia type 1 (SCA1; 164400), and gracile axonal dystrophy (GAD) in mice. The physiologic substrate of Usp14 may therefore contain a monoubiquitin side chain, the removal of which would regulate processes such as protein localization and protein activity. Expression of Usp14 is altered in homozygous ax(J) mice as a result of the insertion of an intracisternal A particle (IAP) into intron 5 of Usp14. In contrast to other neurodegenerative disorders such as Parkinson disease and SCA1 in humans and GAD in mice, neither ubiq-

ubiquitin-positive protein aggregates nor neuronal cell loss was detectable in the CNS of ax(J) mice. Instead, these mice had defects in synaptic transmission in both the central and peripheral nervous systems. These results suggested that ubiquitin proteases are important in regulating synaptic activity in mammals.

[47306] It is appreciated that the abovementioned animal model for USP14 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[47307] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[47308] Deshpande, K. L.; Seubert, P. H.; Tillman, D. M.; Farkas, W. R.; Katze, J. R. : Cloning and characterization of cDNA encoding the rabbit tRNA-guanine transglycosylase 60-kilodalton subunit. Arch. Biochem. Biophys. 326: 1-7, 1996. ; and

[47309] Wilson, S. M.; Bhattacharyya, B.; Rachel, R. A.; Coppola, V.; Tessarollo, L.; Householder, D. B.; Fletcher, C. F.; Miller, R. J.; Copeland, N. G.; Jenkins, N. A. : Synaptic defects in at.

[47310] Further studies establishing the function and utilities of USP14 are found in John Hopkins OMIM database record

ID 607274, and in cited publications numbered 5389–5390 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177) is another VGAM1334 host target gene. C17orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf26 BINDING SITE, designated SEQ ID:29184, to the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, also designated SEQ ID:4045.

[47311] Another function of VGAM1334 is therefore inhibition of Chromosome 17 Open Reading Frame 26 (C17orf26, Accession NM_139177). Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf26. MO25 (Accession NM_016289) is another VGAM1334 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MO25, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:18413, to the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, also designated SEQ ID:4045.

[47312] Another function of VGAM1334 is therefore inhibition of MO25 (Accession NM_016289). Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617) is another VGAM1334 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ ID:6227, to the nucleotide sequence of VGAM1334 RNA, herein designated VGAM RNA, also designated SEQ ID:4045.

[47313] Another function of VGAM1334 is therefore inhibition of

Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617). Accordingly, utilities of VGAM1334 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1335 (VGAM1335) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[47314] VGAM1335 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1335 was detected is described hereinabove with reference to Figs. 1-8.

[47315] VGAM1335 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus A. VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[47316] VGAM1335 gene encodes a VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1335 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1335 precursor RNA is designated SEQ ID:1321, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1321 is located at position 27935 relative to the genome of Human Adenovirus A.

[47317] VGAM1335 precursor RNA folds onto itself, forming VGAM1335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[47318] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1335 folded precursor RNA into VGAM1335 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1335 RNA is designated SEQ ID:4046, and is provided hereinbelow with reference to the sequence listing part.

[47319] VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1335 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[47320] VGAM1335 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1335 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1335 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[47321] The complementary binding of VGAM1335 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1335 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1335 host target RNA into VGAM1335 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[47322] It is appreciated that VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1335 host target genes. The mRNA of each one of this plurality of VGAM1335 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1335 RNA, herein designated VGAM RNA, and which when bound by VGAM1335 RNA causes inhibition of translation of respective one or more VGAM1335 host target proteins.

[47323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1335 gene, herein designated VGAM GENE, on one or more VGAM1335 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[47324] It is yet further appreciated that a function of VGAM1335 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of viral infection by Human Adenovirus A. Specific functions, and accordingly utilities, of VGAM1335 correlate with, and may be deduced from, the identity of the host target genes which VGAM1335 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[47325] Nucleotide sequences of the VGAM1335 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1335 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1335 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1335 are further described hereinbelow with reference to Table 1.

[47326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1335 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1335 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[47327] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1335 gene, herein designated VGAM is inhibition of expression of VGAM1335 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1335 correlate with, and may be deduced from, the identity of the target genes which VGAM1335 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[47328] Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6, Accession NM_021615) is a VGAM1335 host target gene. CHST6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST6 BINDING SITE, designated SEQ ID:22244, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47329] A function of VGAM1335 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 6 (CHST6, Accession NM_021615). Accordingly, utilities of

VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST6. Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641) is another VGAM1335 host target gene. RB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RB1 BINDING SITE, designated SEQ ID:43705, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47330] Another function of VGAM1335 is therefore inhibition of Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641), a gene which probably acts as a regulator of other genes. Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1. The function of RB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088) is another VGAM1335 host target gene. ZNF2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF2 BINDING SITE, designated SEQ ID:22068, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.

[47331] Another function of VGAM1335 is therefore inhibition of Zinc Finger Protein 2 (A1-5) (ZNF2, Accession NM_021088). Accordingly, utilities of VGAM1335 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF2. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM1335 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24843, to the nucleotide sequence of VGAM1335 RNA, herein designated VGAM RNA, also designated SEQ ID:4046.
